Gardening in Sandy Soils

Katie Wagner, Michael Kuhns, and Grant Cardon

This fact sheet covers the basics of clay, silt and sand soils with an emphasis on gardening in soils with a high sand content. It includes information on the composition of sandy soils, gardening tips for managing sandy soils, and the types of plants that grow best in sandy soils.

Introduction

Sandy soils must be managed differently from other soils to ensure healthy plant growth. Sand-dominated soil textures include loamy sand (at least 70% sand) and sand (at least 90% sand). Soil texture can be determined by a soil test (see <u>http://www.usual.usu.</u> <u>edu/</u> for more information on soil testing in Utah). Generally, soils that contain greater than 70% sand are considered unacceptable as topsoil material due to poor water and nutrient retention capacities fingers and does not maintain its shape when formed into a ball. Individual sand particles also can be seen with the naked eye. Compared to other soil textures, sand has low surface area and low charge, and hence, does not attract and retain water or nutrients. Due to this quality, sand freely drains and is typically nutrient poor. Natural sands with a variety of particle sizes are difficult to compact; however, dune and beach sands with more uniform particle sizes will pack tightly over time. Sandy soils provide good gas diffusion around plant roots, even when tightly packed.

How can sandy soils be improved?

The best amendment for sandy soils is organic matter. Organic matter refers to materials derived from once-living sources. Composted tree bark,

(see <u>USU Extension</u> fact sheet <u>Topsoil</u> <u>Quality Guidelines for</u> <u>Landscaping</u>).

What is sand?

Sand is the largest of the three soil particle sizes, sand, silt and clay. Sand is 0.05 to 2 millimeters in diameter. Wet sandy soil feels gritty when rubbed between two

Sand particles can be seen by the naked eye

wood chips, straw, or leaves, manures and green-waste are all examples of organic matter. Organic matter that is low in nitrogen, like wood, bark, and straw, needs to be composted first before it can be incorporated into the soil. High nitrogen and previously composted materials can be directly incorporated. Nurseries, garden centers, or composting companies sell many different mixtures of organic matter. Read the label or ask for a list of ingredients so you know when using drip irrigation in sand it is important to position drip emitters directly above the root zone to ensure that plants get water. The water intake rate of sandy soil is 1 to 10 inches per hour and it takes

exactly what you are purchasing. You can also make your own compost at home. Compost is used rather than raw organic matter because it usually has more nitrogen and is less likely to tie up minerals or contain toxic materials. See the USU Extension fact sheet Backyard Composting in Utah for more information on

Organic matter is the best amendment for sandy soils

making compost. Clay is not a good amendment option for sandy soils because by mixing the wrong proportion of clay and sand, you might produce a material similar to low-grade concrete. Any time organic matter or other soil amendments are added to soils, they should be thoroughly mixed-in.

What are management implications for gardening in sandy soils?

Sandy soils should be managed differently from

other soil textures with higher percentages of clay. Because sand freely drains, it must be irrigated frequently to provide adequate water for plant growth. Water moves rapidly downward through sand and does not spread laterally to any great extent. Since water will not move much laterally,

Position drip emitters close to plant roots in sandy soils

approximately half an inch of water to recharge a one-foot depth of sandy soil.

Sandy soils must also be fertilized more frequently than soil with other textures since nutrients are not retained on sand surfaces around plant roots for long. Adding organic matter will improve both

the water-holding and nutrient-retention capacities of sandy soils. Sandy soils may not provide adequate physical support for plants with heavy tops, like trees. Therefore trees may need to be staked for the first few growing seasons to prevent them from falling over from wind or heavy snow and ice.

What types of plants grow well in sandy soils?

Plants that prefer well-drained, and often droughty

root zone conditions grow well in sandy soils. Gardeners may experience difficulties growing plants that prefer higher moisture levels because plantavailable moisture in sand is used much quicker than with finer textures, like clay. Although most tree root growth is shallow, certain species, like spruce,

have very shallow roots and should not be grown in sandy soils. For a listing of trees that are tolerant of dry soils, see <u>www.treebrowser.org</u> (the "tolerance of drought" characteristic). For a listing of a variety of water-wise plants, see <u>www.waterwiseplants.</u> <u>utah.gov</u> (select within "soil" the conditions that best represent your soil; gardeners with sandy soils should select "does well in sandy soils").

A few examples of trees and shrubs found in Utah that will grow well in sandy soils and that are very drought tolerant are included below.

* Utah Native

Common Name	Scientific Name
Agave, Utah*	Agave utahensis
Apache Plume*	Fallugia paradoxa
Ash, Singleleaf*	Fraxinus anomala
Boxelder or Ash-leaved or Manitoba Maple*	Acer negundo
Cliffrose*	Purshia mexicana
Coffeetree, Kentucky	Gymnocladus dioicus
Corktree, Amur	Phellodendron amurense
Cypress, Arizona	Cupressus arizonica
Elm, Camperdown	<i>Ulmus glabra</i> 'Camperdownii'
Elm, Lacebark or Chinese	Ulmus parvifolia
Elm, Siberian or Chinese	Ulmus pumila
Fernbush*	Chamaebatiaria millefolium
Fremont Holly*	Mahonia fremontii
Ginkgo or Maidenhair Tree	Ginkgo biloba
Goldenraintree	Koelreuteria paniculata
Green Mormon Tea*	Ephedra viridis
Hackberry, Common	Celtis occidentalis
Hawthorns	Crataegus species
Honeylocust	Gleditsia triacanthos
Junipers	Juniperus spp.

Utah serviceberry is very drought tolerant and well adapted to growing in sandy soils

Common Name	Scientific Name
Maple, Tatarian	Acer tataricum
Mountain-mahogany, Curlleaf*	Cercocarpus ledifolius
Mountain-mahogany, Littleleaf*	Cercocarpus intricatus
Mulberry, Red	Morus rubra
Mulberry, White	Morus alba
Oaks	Quercus species
Oak, Gambel*	Quercus gambelii
Oak, Shrub Live*	Quercus turbinella
Pines	Pinus spp.
Pinyon, Singleleaf*	Pinus monophylla
Pistache, Chinese	Pistacia chinensis
Rabbitbrush, Rubber*	Chrysothammus nauseosus
Rubber Tree, Hardy	Eucommia ulmoides
Sage, Big*	Artemisia tridentata
Sage, Black	Artemisia nova
Sage, Dorr*	Artemisia dorrii
Sage, Fringed	Artemisia frigida
Sage, Sand*	Artemisia filifolia
Saltbush, Fourwing*	Atriplex canescens
Serviceberry	Amelanchier spp.
Shadscale*	Atriplex confertifolia
Zelkova, Japanese	Zelkova serrata
