The Impact of Farm Ties on Concern About Climate Change

Jordan Risley, Utah State University
Research Mentor: Douglas Jackson-Smith, Utah State University

Climate Change
- Human impact on the earth’s climate has been widely accepted by most scientists.
- The past three decades have been successively hotter than any recorded since 1850 and will continue to rise in the future.
- Agriculture is one of the most vulnerable sectors in the American economy in regards to the adverse effects of climate change.
- Research has shown that farmers have less concern about climate change.
- Although many studies measure farmers’ perspectives on climate change, little to none has been done on farm ties.

Research Question
My research question is: Do people with farm ties have less concern for climate change?
- I hypothesize that social and cultural connections to farmers lead urban respondents to share similar climate change views as the agricultural community.

Research Methods
- Data was gathered via a public intercept survey in front of 16 grocery stores that holds about 4,400 responses from the Salt Lake, Cache valleys.
- The overall response rate is 44%, and is representative of both genders.
- Specific questions ask about concern for various topics, focus was aimed at concern for climate change and whether or not the participant has a relative or is a current farmer.

Respondent Profile
- 28% of all respondents currently farm or have relatives that farm.
- 40% of respondents are very concerned about climate change.

Findings
- Farm ties have a significant relationship to concern about climate change.
- People with farm ties are less likely to be concerned.

Implication
- Farmers’ perspectives transcend across social boundaries and effect a large group of the urban population.
