Online Prehealth Advising
IMPACT ANALYSIS
SPRING 2017 - FALL 2020
Powered by Academic and Instructional Services
Report Presented August 2021
Exposure to Online Prehealth Advising Increases Student Persistence to the Next Term

USU students who attended an online prehealth advising session on Canvas experienced a significant increase in persistence to the next term compared to students who did not attend. The program help USU retain an estimated 33 at-risk students. That equals $148,958.93 in earned tuition attributable to this USU program.

ABSTRACT:
At Utah State University, various online, Canvas-based advising programs complement the traditional in-person advising program. The online prehealth advising service assists students who are considering health professions graduate school.

This report explored the association between online prehealth advising participation and student persistence to the next term at Utah State University.

METHODS:
The Office of University and Exploratory Advising collected students’ attendance data as students signed up and participated in each advising course. Subsequent analysis compared students who participated in the online prehealth advising program to similar students who did not participate in the program.

Prediction-based propensity score matching (PPSM) was the method of student comparison. This technique matches students who participate in the program of inquiry with similar non-participant students. Two factors determine student similarity: (1) the students’ computer-predicted level of academic persistence and (2) the students’ propensity to participate.

FINDINGS:
Participant and comparison students were 99% similar after PPSM matching. Analysis used difference-in-difference testing to assess the advising program’s impact. In the sample of 1,174 students, analysis found a significant positive correlation between program exposure and academic persistence (DID = 0.0285, p = 0.0193).

This equals 33 (CI: 11 to 56) students retained through this program, or $148,958.93 (CI: $49,986.31 to $254,475.76) in retained tuition.

Does attendance at online prehealth advising sessions influence student persistence to the next term?

**WHY PERSISTENCE?**
Student success can be defined in various ways. One valuable way to view student success is through progress towards graduation. Progress towards graduation reflects students acquiring the necessary knowledge and accumulating credential that prepare them for graduation. The Center for Student Analytics measures progress towards graduation through the index measurement of student persistence. We define persistence as continuous semester-to-semester enrollment at Utah State University (e.g. fall-to-spring). As a measurement, persistence facilitates a quick feedback loop to identify what’s working well and what can be better (Bear, Hagman, & Kil, 2020).

**WHY USE ANALYTICS?**
Higher education professionals labor to support student success in all its various forms—not just through persistence. However, professionals now have access to far more data than they can feasibly interpret and use to support student success without the help of analytics. Fortunately, USU has access to professional tools that can process and organize data into insights that have historically been hidden from view (Appendix A). University professions can leverage insights to directly influence student success (Baer, Kil, & Hagman, 2019). Indeed, analytics aligns with USU’s mission to be a “premier student-centered land-grant institution.” Analytics enables USU professionals to know what is going well and what could be better (see Appendix G for the evaluation cycle).

**ACADEMIC ADVISING & PERSISTENCE**
Academic advising enriches the university experience by increasing student exposure to several statistically-significant drivers of student persistence. These drivers include: “(1) student satisfaction with the college experience, (2) effective educational and career planning and decision making, (3) student utilization of campus support services, (4) student-faculty contact outside the classroom, and (5) student mentoring” (Cuseo, 2003).

USU prehealth advising makes a difference in undergraduates’ lives by facilitating progress to graduation and a smooth transition to health professions graduate school.
Impact Analysis Results

**SUMMARY STATISTICS**
- Overall Change in Persistence: 2.85% (0.95% - 4.75%)
- Overall Change in Students (per year): 33 (11 - 56)
- Analysis Terms: Sp17, Su17, Fa17, Sp18, Su18, Fa18, Sp19, Su19, Fa19, Sp20, Su20, Fa20
- Students Available for Analysis: 1,174 Students
- Students Matched for Analysis: 1,174 Students
- Percent of Available Students Matched for Analysis: 100%
- Percent of All Undergraduate Students Participating: 4.04%

**STUDENT IMPACT**
Students who participate in online prehealth advising experience a significant increase in persistence to the next term. The estimated increase in persistence is equivalent to retaining 33 (CI: 11 - 56) students each year who were otherwise not expected to persist. This represents an estimated $148,958.93 (CI: $49,986.31 - $254,475.76) in retained tuition per year, assuming an average tuition of $4,544.21 (see Appendix C for estimated tuition table).

**PARTICIPANT DEMOGRAPHICS**
Matching procedures for this analysis resulted in the inclusion of 100% of available participants. Students were 58.26% male and 72.15% first-time college students. Analysis focused on undergraduate students.

**PARTICIPANT POOL**
The sample features USU undergraduate students from both the Logan campus, the statewide campuses (USU Eastern and USU Blanding), and the various regional campuses throughout Utah. The sample excludes non-degree-seeking students, such as students pursuing certificates.

**COMPARISON POOL**
The comparison pool includes degree-seeking students from any campus who were eligible to enroll in online prehealth advising sessions but did not choose to participate. Analysis used prediction-based propensity score matching methodology to identify comparison students. Comparison students must be similar to participants based on (1) their demographic and educational characteristics and (2) their likelihood to persist to the next semester.

**FIGURE 1. DEMONSTRATED PROGRAM IMPACT ON PERSISTENCE.**
At the start of analysis, the pools of participant students and comparison students both have highly similar computer-predicted persistence scores. After analysis, differences emerge between the two groups in terms of their actual semester-to-semester persistence outcomes. What accounts for the difference between predicted vs. actual persistence outcomes for two otherwise highly similar pools of USU students?

Exposure—or no exposure—to the program of inquiry is the variable responsible for differences between the two groups. Prediction-based propensity score matching has successfully controlled for other confounding variables to isolate program exposure as a measurable independent variable.

Prepared by Academic and Instructional Services
Impact by Persistence Quartile

USU’s predictive analytics model assigns each USU student a predicted persistence score—a measure of the student’s likeliness to continue from one semester to the next in timely, unbroken progress.

Based on a student’s prediction score, the student will belong to one of four persistence quartiles. Students in the top persistence quartile, for example, are the most likely to persist and make timely progress toward USU graduation. Students in the bottom persistence quartile are the least likely to persist from semester to semester. The participant pool and the comparison pool both include students from each predicted persistence quartile.

The online prehealth advising program exhibits statistically significant results for students in the bottom quartile of predicted persistence scores. Online advising program activities retain an estimated 11 (CI: 1 to 22) bottom quartile students each year. About 9% of the students in the advising participant pool were people with bottom quartile predicted persistence scores.

Students in the bottom persistence quartile are very likely to face interruptions and pauses in their education. Interruptions and pauses make it less likely that the student will successfully graduate. Through its impact on these highest-risk students, online prehealth advising is helping to change USU’s graduation outcomes.

Impact by Term

Students have online prehealth advising services available to them year-round. Most students use the service in either the spring semester or the fall semester. Only a few students use the service during the summer. There tends to be a larger sample of students participating in online prehealth advising during fall than during spring.

Fall 2017 and Fall 2019 were the two semesters that produced statistically significant differences between the participant group’s and the comparison group’s persistence levels. Fall 2017 advising contributed to the retention of 7 (CI: 1 to 14) students not otherwise expected to persist; Fall 2019 advising helped retain 13 (CI: 1 to 22) students.

Decision-makers should bear in mind that the appearance of poor program persistence in certain semesters (e.g. summer 2020) is not statistically significant.
Student Segment Findings

**IMPACTED STUDENT GROUPS**

In addition to the holistic, bird’s-eye view of programmatic impact that we have discussed so far, USU’s predictive analytics software also provides insight about online prehealth advising’s effect on specific segments and clusters of the student body. This section of the report explains the program’s effect on some of these behavioral and demographic groups.

Please note that the student groups identified below are not mutually exclusive. Table 1 shows all student subgroups that experienced a significant change in persistence from their exposure to online prehealth advising. Appendix A lists all subgroups that did not experience significant change in persistence after exposure to advising.

In general, students who participated in online prehealth advising sessions experienced an increase in persistence. The following paragraphs present this program’s impact on specific segments of the student body.

**Degree Type (Figure 4).** 59% percent of online prehealth advising participants were non-STEM majors, while about 41% were STEM majors. Results were statistically significant for non-STEM students in particular.

Non-STEM students experienced an above-average positive impact from the online advising program, relative to the overall advisee population. Non-STEM students who participated in advising experienced a 4.13% increase in persistence (CI: 1.63% to 6.63%).

**Course Modality.** USU students either take their classes all in-person, all online, or in a mix between in-person and online classes. 54% of the participant pool were students who take their classes in-person, 3% were all online, and 43% took a mix of in-person and online classes. Results were statistically significant for in-person students in particular.

Exposure to online prehealth advising improves in-person student persistence at an above-average rate compared to the program’s impact on the general advisee population. In-person students who participated in advising experienced a 4.03% increase in persistence (CI: 1.53% to 6.53%).

**Student Gender (Figure 5).** Women represented 42% of the advisee participant pool, while men represented 58% of the pool. Results were statistically significant for women in particular.

Women who attended online prehealth advising sessions experienced positive effects from the program at an above-average rate compared to the overall participant pool impact. Women advisees experienced a 3.90% increase in persistence (CI: 0.90% to 6.90%).

**Terms Completed.** 30% of advisees were new students (0 terms completed), 35% were early career students (1 to 3 terms completed), and 35% were later career students (4 or more terms completed). Results were statistically significant for new students and later career students in particular.

Both new students and later career students experienced above-average effects from the online prehealth advising program compared to the overall advisee population. Early career students increased in persistence by 4.97% (CI: 1.57% to 8.37%), and later career students increased in persistence by 3.63% (CI: 0.93% to 6.33%).

**Student Type.** 73% of advisees were first-time college students, 13% were transfer students, and 14% were readmitted students. Results were statistically significant for first-time college students in particular.

First-time college students experienced an above-average positive effect from program exposure, relative to the overall advisee population. First-time students experienced a 3.70% increase in persistence (CI: 1.60% to 5.80%).

**FIGURE 4**

Changes in persistence for STEM major program participants vs. non-STEM major participants.

**FIGURE 5**

Changes in persistence, by gender.

*Results may be less accurate for subgroups with fewer than 250 students

**Model fit refers to the degree to which the comparison is a reliable control group against which to compare the participants. A good comparison group will not deviate significantly from its predicted persistence outcomes. Good fit means there was a <1% difference between the comparison group’s predicted persistence and its actual persistence outcomes. Adequate fit means the difference between predicted and actual persistence was between 1% and 2.9%. Poor fit indicates greater than 3% difference between actual and predicted persistence.
INVESTIGATING THE EXTENT OF DISINTERESTED STUDENT EXPERIENCES

In the Canvas software through which USU provides the online prehealth advising services, students’ clicking activities create a record that provides more information about the program’s ability to hold and engage their interest. The students’ activities on the website generate a status indicator of either “active,” “inactive,” “concluded,” or “deleted.”

Active status means the student has proceeded through the advising course normally and advising is still in progress at the time of analysis. Inactive status means the student either failed to pay tuition or dropped the advising course. Concluded status means the student finished the advising course. Deleted status means the student signed up for advising but did not engage in advising beyond initial registration—not even to formally drop the course. This investigation focused on the proportion of deleted students relative to the overall advisee population. No students in the sample were in inactive status.

About 2.87% of the advising pool signed up for advising without participating further. Fall 2019 was the semester with the greatest number of students in deleted status. Fortunately, the amount of students in deleted status was less than the number of students who signed up for multiple advising sessions, as discussed below.

INVESTIGATING THE EXTENT OF HIGHLY-INTERESTED STUDENT EXPERIENCES

While some students, as discussed above, lost interest in the online prehealth advising program after signing up, other students exhibited above-average levels of interest in the program, signing up for not just one but several instances of the program.

Online prehealth advising offers advising experiences in these tracks: dental, medical, occupational therapy, pharmacy, physical therapy, and physician assistant. About 9.10% of the advisee pool signed up for multiple advising experiences.

About 9.10% of the advising pool signed up for multiple advising sessions. The most common student-selected combinations of prehealth advising tracks were: physician assistant and medical; medical and dental; and, physician assistant and dental. Fall 2019 was the semester with the most instances of multiple enrollment.
Insights & Next Steps

Our analytics process combines a thorough evaluation of the data itself with an equally thorough reflection about the social and institutional context in which the data operates. We use the process visualized above in Figure 7--The Lifecycle of Sustainable Analytics--to transform insights from our data-gathering process into relatable, realistic themes that your department can work with as you begin to implement change. Here are some core conclusions we have identified during our collaborations with your department.

Promoting Multiple Advising Enrollments More Prominently on the Website

Website editing and re-design situations are a great opportunity to consider applying some of the lessons gleaned from this report. One insight this report has revealed is that some students, in their natural process of navigating through the online prehealth advising website, have settled upon certain logical combinations of advising tracks.

The top three student-created combinations of advising tracks were: (1) physician assistant and medical, (2) medical and dental, and (3) physician assistant and dental.

These combinations clue us in as to the way students are thinking when they decide between their various health professions graduate school options.

You have the option to actively promote multiple advising enrollments on the website. Sample language could say: “Can’t decide? Consider sign up for both physical assistant advising and medical advising.”

CORRECTING FOR THE “SOPHOMORE SLUMP”

Many programs exist to help freshmen transition smoothly into higher education and to help juniors prepare for graduation. Sophomores sometimes fall through the cracks because they don’t have as many programs designed for them. The online prehealth advising data reflects a sophomore slump, where students with 1-3 terms completed may experience less statistically significant impact from the program than their peers with 0 terms completed or >4 terms completed.

The online advising program director has expressed interest in reaching out to sophomores more.

THEORETICAL FOUNDATION FOR IMPACT ANALYSES: INPUT, ENVIRONMENT, OUTPUT MODEL (ASTIN, 1993)

STUDENT INPUTS
Students bring different combinations of strengths to their university experience. Student input influences student success, but it does not by itself determine the outcomes.

STUDENT ENVIRONMENTS
A university provides a diverse array of curricular, co-curricular, and extra-curricular activities to enhance the student experience. Students selectively participate to varying degrees in activities. The student’s learning environment influences student success, but it does not by themselves determine these outcomes.

STUDENT OUTCOMES
There are several ways to measure student success. We have chosen persistence as our index measurement of student success. Persistence is continuous enrollment from one semester to the next; it is timely progress toward graduation. The interaction of student inputs and student environments is what determines student persistence.

PPSM IMPACT ANALYSIS
A prediction-based propensity score matching impact analysis can effectively measure university programs’ effect on student persistence. It does so by treating student inputs as a control variable, so as to isolate student environments as the independent variable of study.

Input - Environment - Outcomes
Student success occurs through the combination of two sets of variables: student input and environmental influence (Astin, 1993). Our prediction-based propensity score matching methodology controls for student input variations by matching participant students with similar non-participant students based on their: (1) likelihood to be involved in an environment and (2) their predicted persistence score. By controlling for student inputs, we isolate environmental influence--program exposure--as the independent variable of study.
Appendix B

ANALYTIC DETAILS: ESTIMATING PROGRAMMATIC IMPACT THROUGH PREDICTION-BASED PROPENSITY SCORE MATCHING (PPSM)

Impact analyses are quasi-experiments that compare students who participate in University initiatives to similar students who do not. In an impact analysis, “participants” are students who participate in the program of inquiry. “Comparison students” are similar to participants in profile and behavior, except for participation in the program of inquiry. An impact analysis estimates the effect of the treatment on the treated (ETT). In other words, our analysis estimates how exposure to a student success program affects student persistence outcomes. Such estimations are most appropriate for observational studies with voluntary participation (Geneletti & Dawid, 2011).

Accounting for bias. While ETT is fitting for observational studies with voluntary participation, the phenomenon of voluntary participation introduces the problem of bias. Specifically, students’ voluntary participation in a program results in self-selection bias, where the distinction between participants and non-participants follows natural differences in student profile and behavioral history. Participant students and non-participant students may be innately different from each other. For example, students who self-select into math tutoring (or intramurals or the Harry Potter Club) may be quantitatively and qualitatively different than students who do not use math tutoring (or intramurals or the Harry Potter Club). Prediction-based propensity score matching (PPSM) is a way to account for these differences, reduce the effect of self-selection bias, and increase the validity of an impact analysis.

In PPSM, the matching process pairs participating students with non-participating students who are similar to them in both their (a) predicted persistence and (b) their propensity to participate in an iterative, boot-strapped analysis (Milliron, Kil, Malcolm, & Gee, 2017).

(A) Predicted Persistence. Utah State University uses student data to create a persistence prediction score for each student. The persistence prediction score system serves as an early alert system. It identifies students who may need supplemental resources to support their success at USU. These persistence prediction scores also help our data analysts and data scientists evaluate student-facing programs’ impact on student success. Assessment and evaluation are invaluable practices that foster accountability, efficiency, and innovation in university operations.

A regularized ridge regression model generates the prediction scores, evaluating such student data points as including:

• academic performance;
• degree progress metrics;
• socioeconomic status; and,
• student engagement.

The ridge regression ranking orders each covariate by its predictive power, and the resulting equation generates the persistence prediction score. We match participants with non-participants whose prediction scores are similar to theirs.

(B) Propensity to Participate. Propensity scores, another data point used for PPSM matching, reflect a students likelihood to participate in an initiative (Rosenbaum & Rubin, 1983). A logistic ridge regression modeling process predicts a student’s statistical likelihood to participate in the program of inquiry.

Matching proceeds through bootstrapped iterations that randomly select a subset of participant and comparison students. Within each bootstrapped iteration, we match participants with similar non-participants using 1-to-1, nearest neighbor matching. To match, two students’ persistence and propensity scores must fall within a 0.05 caliper width of each other. The random bootstrapping iterations examine each participant for matching. They ultimately exclude from analysis are any participant students who do not find an adequate match. (For additional details, see Louviere, 2020).

Difference-in-Difference. Difference-in-difference analysis compares participant outcomes to comparison outcomes by comparing the calculated predicted means from the bootstrapped iteration distributions to the actual persistence rates of participating and comparison students. In other words, the analysis looks at the difference between predicted persistence and actual persistence between the two groups of well-matched students. We treat results with alpha <0.05 as statistically significant within a 95% confidence interval. The results finally display the ETT.
Appendix C

ADJUSTED RETAINED TUITION MULTIPLIER

Retained tuition equals the number of retained students multiplied by the USU average adjusted tuition. The numbers in the tuition table below reflect information provided by the USU Budget and Planning Office about tuition rates for the 2018-2019 academic year.

The amounts in the table reflect net tuition—an estimate of tuition that removes all tuition waivers from the overall gross tuition amounts. This net tuition calculation provides a more accurate and more conservative multiplier for understanding the impact of university initiatives on retained tuition.

The table below parses the average adjusted tuition by campus and academic level. The highlighted row indicates the multiplier we used in this analysis.

Appendix E
MATCHING DETAILS

Following prediction-based propensity score matching process described in Appendix B, we were able to match 100% of available participants, or 1,174 students. As a rule, we exclude from analysis any participating students who do not have an appropriate profile/behavior match in the pool of non-participants.

Upon reviewing the matching distributions for predicted persistence (Figure 8) and for propensity to participate (Figure 9), the reader will see that there is substantial overlap between the red and blue lines. This overlap indicates high similarity of profile and behavior between each caliper-pair of students in the participant pool and the comparison pool.

Prior to matching, the participant and comparison students were 78% similar based on students’ predicted persistence (Figure 8) and 63% similar based on students’ propensity to participate in the online prehealth advising program (Figure 9). Following matching, the participant and comparison pools were 99% similar and 97% similar, respectively.

**FIGURE 8. PREDICTION-BASED PROPENSITY SCORE MATCHING: PREDICTED PERSISTENCE**
Participating and comparison students receive prediction persistence scores based on their regression-predicted persistence to the next semester. We run the regression based on the most recent four years of USU student performance data.

**FIGURE 9. PREDICTION-BASED PROPENSITY SCORE MATCHING: PROPENSITY FOR PROGRAM PARTICIPATION**
Participating and comparison students receive regression-predicted propensity scores based on their likelihood to participate in the online prehealth advising program. We run the regression using the most recent four years of USU student data.
## Appendix F

### STUDENT SEGMENT DEFINITIONS

<table>
<thead>
<tr>
<th>Student Subgroup</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 Terms Completed</td>
<td>Students with 0 terms in their collegiate career completed; incoming freshmen</td>
</tr>
<tr>
<td>1 - 3 Terms Completed</td>
<td>Students who have completed 1 to 3 terms in their collegiate career</td>
</tr>
<tr>
<td>4+ Terms Completed</td>
<td>Students with 4 or more terms in their collegiate career completed</td>
</tr>
<tr>
<td>All On-Campus</td>
<td>Students attending all courses face-to-face</td>
</tr>
<tr>
<td>Online or Broadcast</td>
<td>Students attending all courses online or via broadcast</td>
</tr>
<tr>
<td>Mixed or Blended Course Modality</td>
<td>Students attending both face-to-face and online or broadcast courses</td>
</tr>
<tr>
<td>Full-time Students</td>
<td>Undergraduate students enrolled in 12 or more credits</td>
</tr>
<tr>
<td>Part-time Students</td>
<td>Undergraduate students enrolled in less than 12 credits</td>
</tr>
<tr>
<td>First Time in College</td>
<td>Students who enter USU as new freshmen</td>
</tr>
<tr>
<td>Transfer Students</td>
<td>Students who attended another university prior to attending USU</td>
</tr>
<tr>
<td>Readmitted Students</td>
<td>Students who attended USU, left for a time (without filing a leave of absence), and return after re-applying to USU</td>
</tr>
<tr>
<td>Unknown Undergraduate Type</td>
<td>Students with an unknown admitted type</td>
</tr>
<tr>
<td>High School Dual Enrollment</td>
<td>High school students simultaneously taking high school and college courses</td>
</tr>
<tr>
<td>STEM</td>
<td>Students with a primary major in science, technology, engineering, or mathematics</td>
</tr>
<tr>
<td>Non-STEM</td>
<td>Students with a primary major that is not in science, technology, engineering, or mathematics</td>
</tr>
<tr>
<td>Top Persistence Prediction Quartile</td>
<td>25% of the total USU population falls into each quartile. The top quartile contains students with the highest predicted persistence (75th – 100th percentile)</td>
</tr>
<tr>
<td>Third Persistence Prediction Quartile</td>
<td>25% of the total USU population falls into each quartile. The third quartile contains students with the second-highest predicted persistence (50th – 74th percentiles)</td>
</tr>
<tr>
<td>Second Persistence Quartile</td>
<td>25% of the total USU population falls into each quartile. The second quartile contains students with the second-lowest predicted persistence (25th – 49th percentiles)</td>
</tr>
<tr>
<td>Bottom Persistence Quartile</td>
<td>25% of the total USU population falls into each quartile. The bottom quartile contains students with the lowest predicted persistence (1st – 24th percentile students)</td>
</tr>
<tr>
<td>Female</td>
<td>Students identifying as women</td>
</tr>
<tr>
<td>Male</td>
<td>Students identifying as men</td>
</tr>
</tbody>

Appendix G
THE USU CENTER FOR STUDENT ANALYTICS EVALUATION CYCLE

The Impact Evaluation Cycle

Now that this report is complete, we will help you to re-evaluate your program’s future impacts on student persistence. Using the insights in this report, determine an action plan for maintaining or improving program performance. Set a date for the next program performance evaluation, implement your action plan, and continue collecting student participation data. We look forward to helping you again.

EVALUATE & RE-EVALUATE
Submit program participation data to the Center for Student Analytics, and we will run an evaluation. We can help you study persistence outcomes or help you find other ways to measure performance.

REFLECT & DISCUSS
Consider the insights in your impact evaluation report and have a discussion within your department about the key themes of the report.

MAKE DECISIONS
Brainstorm possible strategies for maintaining or improving your program’s impact on USU student success. Aim for outcomes that align with your program’s goals.

PLAN
Make a realistic action plan for implementing your strategic decisions. Determine the “who,” the “where,” and the “when” of your actions.

IMPLEMENT
Put your plans into action. Remember to collect participation data and periodically check the progress of your plans as they are being implemented.
