The Lunar Calibration Workshop

Initiative from the GSICS Research Working Group (last annual meeting in March 2014), in collaboration with CEOS/IVOS

Organisation

EUMETSAT / USGS / CNES / NASA with the support of M. Takahashi (JMA)

Objectives

1. Work across agencies/operators with a common and validated implementation of the USGS ROLO model ➞ one of GSICS’ goal = instrument inter-calibration
2. To share knowledge and expertise on lunar calibration and to provide guidance on the techniques of lunar calibration.
3. First step to provide the international community with validated and traceable version of the USGS ROLO model = GSICS Implementation of the ROLO (GIRO) model ➞ Validated against USGS implementation of ROLO v311g
4. Generate for the first time a reference dataset that could be used for validation/comparisons later on.
Lunar Calibration: Definition of a collaborative framework

- **External datasets to improve the irradiance reference model**
  - (e.g. CNES with Pleiades)

- **US Geological Survey**
  - ROLO lunar irradiance reference model

- **Publication of the enhancements to the ROLO = public domain**

- **NASA MODIS Aqua**
  - Current GSICS reference for VNIR channels

- **EUMETSAT**
  - Instrument Monitoring
  - GIRO lunar irradiance reference model (GSICS Implementation of the ROLO model)

- **GSICS**
  - Inter-calibration products
  - Monitored instruments from GSICS partners

- **GSICS / CEOS-IVOS**
  - Cross-comparisons

- **Instruments from other space and meteorological agencies**

**Publication of the enhancements to the ROLO = public domain**

**GIRO lunar irradiance reference model (GSICS Implementation of the ROLO model)**

**GSICS Inter-calibration products**

**Monitored instruments from GSICS partners**
Outcome from the Lunar Calibration Workshop

- EUMETSAT HQ, 1-4 December 2014
- 14 agencies and departments attended the joint GSICS – CEOS/IVOS lunar calibration workshop (including remote attendees through Webex)
- Potentially 25 instruments + future and (some) past missions
### Instruments

Instruments with lunar observation capabilities, with the minimum number of Moon observations expected to be provided to the Lunar Calibration Dataset (more observations may be available).
Examples of Moon observations from participating instruments
Outcome from the Lunar Calibration Workshop

• All groups prepared input to the GIRO and provided results

• First version of the GSICS lunar observation dataset

• GIRO in agreement with the latest ROLO version over validation test dataset

• A few discrepancies observed when instruments had both GIRO and older ROLO results (in particular beyond 2μm)
  • Most important differences related to the definition of the ROLO version at USGS
    $\Rightarrow$ \( \text{ROLO} = \text{ROLO}_{\text{USGS}} + \text{Driver}_{\text{USGS}} \)
    • \( \text{ROLO}_{\text{USGS}} \) = fixed version number (v311g)
    • \( \text{Driver}_{\text{USGS}} \) has changed!

$\Rightarrow$ Need for version control to ensure software traceability

• Oversampling factor + dark signal estimation = critical

• Sensitivity analysis + uncertainty budget initiated

• Need for establishing a data policy and a GIRO usage policy
### List of actions

| GLCWS_14.1 | NASA and USGS to interact to process the MODIS data with the latest driver to check the agreement with the GIRO. Two methods are tested for the irradiance integration (original MODIS data as provided to USGS initially, and the processing as done for the GIRO). USGS and NASA are invited to report at the next GSICS annual meeting. | 18 Mar 2015 |
| GLCWS_14.2 | NASA and NOAA to interact on the VIIRS lunar data to check the result consistency and to compare their oversampling factor estimates. | 01 Dec 2015 |
| GLCWS_14.3 | EUMETSAT, NASA (VIIRS + Landsat teams) and USGS to interact and investigate the discrepancies observed in the 2.2 microns band. | 01 Dec 2015 |
| GLCWS_14.4 | CNES had the possibility to do dedicated Moon acquisitions with PARASOL. CNES is invited to present the results of the analysis at a further meeting (web meeting or GSICS annual meeting). | 18 Mar 2015 |
| GLCWS_14.5 | All participants to provide lunar irradiances from the missing instruments to the common lunar calibration data set. | 01 Dec 2015 |
| GLCWS_14.6 | EUMETSAT to circulate a draft for a data sharing and GIRO usage policy to the workshop participants. This should include the requirements for newcomers to join the community and get access to the data and the GIRO. | 01 Dec 2015 |
| GLCWS_14.7 | GSICS Data Working Group to identify a suitable mechanism for sharing the lunar calibration dataset. | 01 Dec 2015 |
| GLCWS_14.8 | All participants to report any restrictions on the use of their datasets in relation to the proposed data sharing policy. | 18 Mar 2015 |
| GLCWS_14.9 | Establish a proposal for the way forward on a comparison of instruments with similar SRFs and phase angles. EUMETSAT will circulate a proposal to the Lunar Calibration Workshop participants by mid January. | 01 Dec 2015 |
| GLCWS_14.10 | The GSICS Data Working Group is asked to develop a procedure for verifying users' implementation of GIRO. | 01 Dec 2015 |
| GLCWS_14.11 | EUMETSAT should implement a systematic bias on the irradiance in the GIRO PERT. | 18 Mar 2015 |
| GLCWS_14.12 | EUMETSAT should implement the proposed formulation for the calculation of the effective wavelength (see the minutes of the Lunar Calibration Workshop). | 18 Mar 2015 |
| GLCWS_14.13 | EUMETSAT to revisit the change of the SRF shape in order to be more realistic. | 18 Mar 2015 |
Ratio between GIRO and ROLO (VCST) results

Discrepancy beyond 2.0 microns – NPP VIIRS results

M11 (2.2µm)

Ratio between GIRO and ROLO (VCST) results

Additional benefits of this collaborative effort

Among others:

• Allows a more comprehensive understanding of the irradiance model

• Strengthen the verification and the validation of the GIRO against the ROLO.

• Discrepancy observed with NPP VIIRS beyond 2 μm = relevant to other missions such as Himawari/AHI, GOES-R, MTG/FCI, EPS-SG/MetImage, etc.
  ✓ Mission preparation ➔ we can anticipate and be ready

• New acquisition mechanisms in place for EUMETSAT future missions (3-axis stabilisation for FCI, similarities between MetImage and VIIRS, etc.) ➔ lessons learnt from existing instruments
  ✓ Mission preparation ➔ we can anticipate and be ready

Conclusions
Conclusions and future work

CONCLUSIONS:

• GIRO = endorsed as official publicly available reference model for lunar calibration

• Lunar calibration community supporting the current collaborative framework

• Traceability to the USGS implementation needs to be formalised

• Version 1.0.0 released (issue beyond 2 μm solved!)

• Since the meeting, GIRO usage and GSICS Lunar Observation Dataset policy terms have been agreed within the Lunar Calibration Community

FUTURE WORK:

• On-going: Set-up the infra-structure to distribute the GIRO (exec + sources) + GLOD
  ➔ Support from GSICS Data Working Group

• Expected improvement of the ROLO + publication = end 2015 / early 2016
  ➔ implementation in the GIRO + new release.

• Organisation of another Lunar Calibration Workshop in 2016 (TBD)

• Developing inter-calibration using the Moon as a transfer target within GSICS

• Continuing collaboration between agencies
For more information:

ROLO/GIRO and absolute calibration

• KNOWN DEFICIENCIES OF THE CURRENT REFERENCE
  • SI traceability
  • Absolute scale uncertainty (5 – 10 % uncertainty in absolute irradiance scale)
  • Residual geometry dependencies
  • Multi-band spectral coverage

• ESTABLISHING THE REQUIREMENTS
  • Defining potential improvements and requirements on user applications
  • Independent method to verify that operational visible calibration meets requirements
  • Support climate applications and past instruments (e.g. no onboard calibration available)

• GOAL
  • Getting absolute uncertainties to under ~1%
  • Surface stability + predictability of the Moon’s brightness = lunar reflectance model valid for all times
  • Level of accuracy of 0.5% is achievable

• WHAT IS NEEDED?
  ➔ Need for a new lunar measurement program (= many years of observations, to characterize the variations of the lunar brightness with phase and librations)
  ➔ Minimum 3 years to capture the libration dependence within the bounds of its relative effect (ROLO operated for more than 8 years)
  ➔ Traceable high-spectral resolution observations over several years with specific measurements to validate the atmospheric correction.

• FUNDING: Currently under investigation (inter-agency [international] collaboration?)
