ETHNOLOGY

A VOCABULARY OF THE IGOROT LANGUAGE AS SPOKEN BY THE BONTOC IGOROTS
By WALTER CLAYTON CLAPP
Order No. 408. Paper, 89 pages, $0.75, postpaid.
The vocabulary is given in Igorot-English and English-Igorot.

THE NABALOI DIALECT
By OTTO SCHEERER

THE BATAKS OF PALAWAN
By EDWARD Y. MILLER
Order No. 403. Paper, $0.25; half morocco, $0.75; postpaid.
The Nabaloi Dialect (65 pages, 29 plates) and the Bataks of Palawan (7 pages, 6 plates) are bound under one cover.

THE BATAN DIALECT AS A MEMBER OF THE PHILIPPINE GROUP OF LANGUAGES
By OTTO SCHEERER

"F" AND "V" IN PHILIPPINE LANGUAGES
By CARLOS EVERETT CONANT
Order No. 407.
These two papers are issued under one cover, 141 pages, paper, $0.80, postpaid.

THE SUBANUNS OF SINDANGAN BAY
By EMERSON B. CHRISTIE
Order No. 410. Paper, 121 pages, 1 map, 29 plates, $1.25, postpaid.
Sindangan Bay is situated on the northern coast of Zamboanga Peninsula. The Subanuns of this region were studied by Mr. Christie during two periods of five and six weeks, respectively.
The 29 plates illustrate the Subanuns at work and at play; their Industries, houses, altars, and implements; and the people themselves.

THE HISTORY OF SULU
By NAJEEB M. SALEEBY
Order No. 406. Paper, 275 pages, 4 maps, 2 diagrams, $0.75, postpaid.
In the preparation of his manuscript for The History of Sulu, Doctor Saleeby spent much time and effort in gaining access to documents in the possession of the Sultan of Sulu. This book is a history of the Moros in the Philippines from the earliest times to the American occupation.

ETHNOLOGY—Continued

STUDIES IN MORO HISTORY, LAW, AND RELIGION
By NAJEEB M. SALEEBY
Order No. 405. Paper, 107 pages, 16 plates, 5 diagrams, $0.25; half morocco, $0.75; postpaid.
This volume deals with the earliest written records of the Moros in Mindanao. The names of the rulers of Magindanao are recorded in five folding diagrams.

NEGritos of ZAMBALES
By WILLIAM ALLAN REED
Order No. 402. Paper, 83 pages, 62 plates, $0.25; half morocco, $0.75; postpaid.
Plates from photographs, many of which were taken for this publication, show ornaments, houses, men making fire with bamboo, bows and arrows, dances, and various types of the people themselves.

INDUSTRIES

PHILIPPINE HATS
By C. B. ROBINSON
Order No. 415. Paper, 66 pages, 8 plates, $0.50 postpaid.
This paper is a concise record of the history and present condition of hat making in the Philippine Islands.

THE SUGAR INDUSTRY IN THE ISLAND OF NEGROS
By HERBERT S. WALKER
Order No. 412. Paper, 145 pages, 10 plates, 1 map, $1.25, postpaid.
Considered from the viewpoint of practical utility, Mr. Walker's Sugar Industry in the Island of Negros is one of the most important papers published by the Bureau of Science. This volume is a real contribution to the subject; it is not a mere compilation, for the author was in the field and understands the conditions of which he writes.

A MANUAL OF PHILIPPINE SILK CULTURE
By CHARLES S. BANKS
Order No. 413. Paper, 53 pages, 20 plates, $0.75, postpaid.
In A Manual of Philippine Silk Culture are presented the results of several years' actual work with silk-producing larvae together with a description of the new Philippine race.
THE CERATINID BEES OF THE PHILIPPINE ISLANDS

By T. D. A. Cockerell

(University of Colorado, Boulder)

ONE TEXT FIGURE

The material on which this revision is based was received through the kindness of Professor C. F. Baker.

The family Ceratinidæ in the Philippine Islands includes two genera readily separated as follows:

a'. Anterior wings with three submarginal cells ............ Ceratina Latreille.

a'. Anterior wings with two submarginal cells; never with metallic color on body ................................................... Allodape Lepeletier.

Genus ALLODAPE Lepeletier

Key to the species.

a'. Females.

b'. With lateral face marks ........................................ palavanica Ckll.

b'. Without lateral face marks.

c'. [Clypeal mark expanded above and below, narrowed in middle (Formosa) ........................................ sauteriella sp. nov.]

c'. Clypeal mark not expanded below.

d'. Very small, about 5 millimeters long .................. cupulifera Vachal.

d'. Larger, 6 millimeters or over.

e'. Clypeal stripe broader; hair of hind legs whitish.

f'. Clypeal stripe narrower; hair of hind legs reddish.

a'. Males.

f'. Scape yellow in front ........................................ mindanaonis Ckll.

f'. Scape black.

g'. Yellow clypeal mark much broader below than above. reversa Ckll.

h'. Very small, hardly 5 millimeters long; small lateral face marks present ................................. cupulifera Vachal.

h'. Larger; no lateral face marks .................................. marginata Smith.
The Philippine species of *Allodape* are very hard to classify, and the present treatment is obviously subject to revision. The species collected by Sauter, at Takao, Formosa, previously recorded by me \(^1\) as *A. marginata* Smith, differs as stated above, and also has lateral face marks in the male; I accordingly call it *A. sauteriella* sp. nov.

*Allodape marginata* Smith.

Evidently common at Los Baños (*Baker 315, 3657*). According to Meade-Waldo, *Prosopis hewitti* Cameron, from Borneo, is a synonym. Another synonym is *Prosopis philippinensis* Ashmead, from Manila.

*Allodape marginata picitarsis* (Cameron).

This form, described from the Laccadive Islands, is not much over 5 millimeters long and is intermediate between *A. marginata* and *A. culpulifera*. A female from Baguio, Benguet (*Baker 5012*), agrees, so far as I can see, with a cotype of *picitarsis* in my collection. However, the form is so close to *A. marginata* that it may well represent an independent variation, unconnected genetically with true *picitarsis*.

*Allodape mindanaonis* Cockerell.

Typical females (*Baker 3164*), from Dapitan, Mindanao, are as large as *A. marginata* and are very closely allied to it. The variety *a*, from the same locality (*Baker 3671*), has lateral face marks, and the scape is yellow in front. Two females from Tacloban, Leyte (*Baker 3668*), are referred here, but possibly the male will show that the Leyte form is separable. They are of the smaller size, variety *a*. It appears that *A. mindanaonis* is a distinct species, the male being easily distinguished from *A. marginata*. It is possible, however, that the large and small Mindanao forms should be separated, in which case the male referred to will go with the smaller, described as var. *a*. This has the yellow of the upper part of the clypeus much more reduced than in the female of *A. marginata picitarsis*. As the variety *a* is now represented by several specimens, it may well take a name, as *Allodape mindanaonis reducta* var. nov. (*type Baker 3163*).

*Allodape cupulifera bakeri* var. nov.

Evidently abundant at Los Baños; also found on Mount Maquilin (*Baker 3656, 3658*). It is readily known from *A. marginata* by its smaller size. This Philippine form of *A. cupulifera*

differs from the typical extra-Philippine insect, from the Asiatic mainland, by having the male scape entirely black. It may, therefore, take the name *A. cupulifera bakeri* var. nov.; type locality, Los Baños (Baker 3655).

**Allodape palavanica** sp. nov.

Female, 6.5 millimeters long; like *A. marginata*, but clypeus practically all yellow and narrow lateral face marks developed; hair of hind legs whitish as in *marginata*. Perhaps only a variety, but in view of the locality, probably a distinct species.

**PALAWAN, Puerto Princesa** (Baker 5009).

**Allodape reversa** sp. nov.

Male, 4 millimeters long, or slightly more; like *A. cupulifera*, but clypeus with the light area broadened below, covering the whole apical part; the vertical band very broad, but not expanded above; no lateral face marks; tarsi ferruginous. The scape is all black.

**PALAWAN, Puerto Princesa** (Baker 5011).

The accompanying female, from the same place (Baker 5010), does not materially differ from *A. cupulifera*. This may be no more than a variety of *A. cupulifera*. The whole group of *Allodape*, described above, is very compact and is uniform in the principal characters. Differences in the venation do not appear to be constant for particular species and races. In Luzon, Palawan, and Mindanao, as on the Asiatic mainland, large and small forms coexist. It is probable that each island, when well separated from the others or of any considerable size, has a race or species of its own; but if this is true, it may yet be found that the characters of these races are mainly or wholly confined (so far as external appearances go) to one sex, or are such as occur in occasional varieties in the other races. The further study of this problem should be in the hands of a resident naturalist.

*Allodape jucunda* Smith, which has been erroneously listed from the Philippine Islands, is a South African species.

**Genus** **CERATINA** Latreille

Three subgenera of *Ceratina* are represented in the Islands.

**Key to the subgenera of Ceratina.**

α. Very bright emerald green; male abdomen with black spots. **Pithitis** Klug.

α². Black, with the thorax and abdomen above conspicuously marked with yellow ........................................... *Ceratinidia* Ckll. and Porter.

α³. Small black species; thorax and abdomen above not marked with yellow. **Ceratina** Latr.
Subgenus Pithitis Klug

Ceratina sexmaculata Smith.

Apparently common at Los Baños (Baker 307, 3659). I have it also from India and Formosa.

Subgenus Ceratinidia Cockerell and Porter

Key to the species.

a'. Males.

b'. Clypeus dark, with a very broad transverse light bar, which has a median rounded lobe above. tropica Crawford.

b'. Clypeus all, or nearly all, yellow.

c'. Cheeks, occiput, pleura, and legs entirely yellow. flavolateralis Ckll.

c'. Cheeks dark, with a yellow stripe.

d'. Flagellum long, pale yellowish fulvous beneath, except the apex, which is broadly black. benguetensis Ckll.

d'. Flagellum short, dark.

e'. Scape only partly light in front; yellow border of prothorax entire. philippinensis Ashm.

e'. Scape wholly light in front; yellow border of prothorax interrupted. compacta Sm.

a'. Females.

f'. Lateral face marks divided.

g'. Lateral face marks each divided into two spots. tropica Crawford.

g'. Lateral face marks divided, but the upper part elongated. philippinensis humilior Ckll.

f'. Lateral face marks forming continuous bands.

h'. Marginal cell and region beyond fuliginous; pleura with a large vertical yellow band, constricted in middle. fuliginosa Ckll.

h'. Marginal cell not fuliginous; pleura without a vertical band.

i'. Pleura with a yellow spot behind the tubercles. philippinensis Ashm.

i'. Pleura entirely black. nigrolateralis Ckll.

Ceratina philippinensis Ashmead.

The records of C. hieroglyphica Smith from the Philippines doubtless refer to this species, which is very closely allied. Ceratina philippinensis appears to be common at Los Baños (Baker 5); but it also occurs at Baguio, Benguet (Baker 4996); Butuan, Butuan, Mindanao (Baker 3653); Cagayan, Mindanao (Baker 3654); and on the Cuernos Mountains, Negros (Baker 3131). Ceratina compacta Smith was described from a supposed female from the Philippine Islands, but the description agrees almost exactly with the male of C. philippinensis. The only apparent differences are indicated in the preceding key to the species. Ceratina compacta was doubtless a male, and it is very probable that it is specifically identical with philippinensis, in which case it has priority.
Ceratina philippinensis nigrolateralis subsp. nov.

Female.—Rather small; length, 5 to 6.5 millimeters; yellow markings smaller than in C. philippinensis, no yellow spot on pleura behind tubercles. The two specimens received are possibly of different species, but probably indicate varieties only; they differ thus:

(a) nigrolateralis, type. Length, 6.5 millimeters; lateral face marks continuous; mesothorax with four short linear marks; second submarginal cell broad; first abdominal segment black with three rather small yellow marks (Baker 3837).

(b) humilior var. nov. Length, 5 millimeters; lateral face marks divided in middle, but upper division elongated (broad median clypeal band as in philippinensis); mesothorax entirely black; second submarginal cell very narrow; first abdominal segment yellow with a black mark on each side (Baker 3836).

PALAWAN, Puerto Princesa.

This species is close to C. morawitzii Sickmann, from Formosa, agreeing in the sculpture of the mesothorax. It differs from morawitzii by having, in the typical nigrolateralis form, only the fifth abdominal band entire, and in the humilior form the segments beyond the third without bands. I find, however, that morawitzii varies in the abdominal banding, so that, apart from geographical considerations, I would be inclined to call the Palawan insects varieties of morawitzii rather than of philippinensis. If the philippinensis type of Ceratina is derived from morawitzii and reached the Islands via the Malay Archipelago and Borneo, it is not surprising to find an intermediate form on Palawan. By the sculpture of the mesothorax, typical philippinensis is to be associated with C. morawitzii and not with C. hieroglyphica.

In this whole series we have to do with variable characters which here and there reach conditions of relative stability, permitting us to separate local races or species; but it may be that large series will show that the ranges of variation overlap or that the normal characters of one form are represented by occasional varieties of another. An easy way out of the difficulty would be to call all these insects by one name and simply remark that the species is variable; but this would obscure the very facts which we are most anxious to investigate. An intensive study of such a series may show that in the formation of allied races or species there has been no modification of the determiners or genes whatsoever, but that they have simply been sorted out in various combinations for heterozygous forms. Thus, supposing that nigrolateralis and humilior, described above, are
merely “individual varieties” of the same Palawan stock, it would be possible for a breeder in the course of time to sort them out and colonize each one on a separate island, producing what would then be regarded, by all ordinary rules, as two perfectly distinct species. On the other hand, we do not know without further inquiry that these forms have not already been ecologically isolated in some way, or are mutually infertile and now specifically distinct. The local collector, obtaining good series, especially of the males, may be able to decide.

The type of *C. morawitzii* came from China.

*Ceratina fuliginosa* sp. nov.

*Female.*—Length, about 9 millimeters; black, marked with yellow in the same manner as *C. philippinensis*, but the greater part of labrum and mandibles yellow; frontal spots little diverging; yellow of upper border of prothorax separated from that of tubercles; mesopleura anteriorly with a very broad, vertical yellow band, constricted in middle; posterior face of metathorax all yellow except triangular basal inclosure; middle and hind tibiae and tarsi without yellow; yellow band on second abdominal segment broad and continuous, of equal width throughout; a narrow apical band on fourth segment, but that on second is basal, as well as that on third. Wings dusky, the marginal cell and beyond strongly fuliginous; scape with the lower half yellow in front; underside of abdomen largely pale; coxae, especially the hind ones, marked with yellow; on underside of thorax yellow bands start from middle coxae and extend forward, converging to the middle line. Mesothorax densely punctured anteriorly.

PALAWAN, Puerto Princesa (*Baker 3833*).

A very distinct species, somewhat related to *C. ridleyi* Ckll., from Singapore, but easily known by the partly fuliginous wings and other characters.

*Ceratina tropica* Crawford.

Apparently widespread; specimens come from Los Baños, Luzon (*Baker 4*), and Dapitan, Mindanao (*Baker 3130, 3132*). The type locality is Manila.²

*Ceratina flavolateralis* sp. nov.  Fig. 1a.

*Male.*—Length, about 8 millimeters; shining, bright chrome yellow, with the following parts black: Vertex, middle of front, upper part of supraclypeal area (the supraclypeal mark is very broadly triangular), mesothorax (except a broad yellow band

² See *Proc. U. S. Nat. Mus.* (1911), 38, 119; (1911), 39, 636.
on each side and two stripes on disk), area of metathorax (which is longitudinally impressed in middle), six very broad, entire bands on abdomen (the last with a yellowish patch in middle), and apical segment (which is strongly bilobed, the lobes rounded and margined with ferruginous). Scape yellow; flagellum broken in type, but dark at base, reddish beneath; lateral face marks ending above, at level of lower ocellus, away from orbital margin; tegulae amber-colored; wings rather dusky; stigma dull ferruginous; second submarginal cell very broad below, narrowed nearly to a point above; a strong keel between antennæ.

LUZON, Laguna, Los Baños (Baker 547).

This is the species reported from the Philippine Islands as \textit{C. beata} Cameron. It is larger than true \textit{beata} of Ceylon, Burma, and Tenasserim and is, I think, certainly distinct. Unfortunately descriptions of \textit{beata} refer only to the female. \textit{Ceratina kosemponis} Strand, from Formosa, is also allied, agreeing in many details of coloration, but with the end of the abdomen different.

\textit{Ceratina benguetensis} sp. nov. Fig. 1b.

\textit{Male.}—Length, about 7.5 millimeters; rather slender; black, with the following parts yellow: Mandibles, labrum, face (which is narrow) up to level of antennæ (except upper margin and corners of supraclypeal area), lateral face marks extending nearly halfway up sides of front, scape, narrow, obscure line along posterior orbits, lateral margins of the very smooth and shining mesothorax, prothorax (except a large patch on each side in front of tubercles), very large irregularly triangular patch on mesopleura, scutellum, triangular mark on axillæ, postscutellum, most of sides of metathorax (uniting posteriorly), triangular area (crossed by a black bar) beneath hind wings, middle of mesosternum (broadening behind), anterior legs (except reddish small joints of tarsi), middle trochanter (except black patch above), femur (except basal spot) and tibia, hind coxae and trochanters in part, and three broad bands on abdomen, the third at base of third segment, the first (really base of first segment) united by a median yellow line with second. Flagellum long and slender, black above, pale fulvous beneath except the last two joints, which are an intense black, the last joint somewhat enlarged; tegulae testaceous; wings very long,
strongly dusky; stigma long, piceous; second submarginal cell narrowed above, but not nearly to a point; area of metathorax with a fine plicatulate sculpture; apex of abdomen broad, margined with testaceous, with a strong median tooth and with salient lateral angles; dorsal abdominal segments 4 to 6 with coarse black hair.

LUZON, Baguio, Benguet (Baker 4997).

A distinct and remarkable species, allied by the structure of the abdomen to C. lepida Smith (India and Assam) and to C. ridleyi Cockerell (Singapore).

Subgenus Ceratina Latreille

Ceratina dentipes Friese.

LUZON, Laguna, Los Baños (Baker 314).

This species was originally described from Buitenzorg, Java; it is allied to Palæarctic species.
ILLUSTRATION

TEXT FIGURE

PUBLICATIONS FOR SALE BY THE BUREAU OF SCIENCE, MANILA, PHILIPPINE ISLANDS—Continued

BOTANY

A FLORA OF MANILA
By Elmer D. Merrill

Order No. 419. Paper, 490 pages, $2.50, postpaid.

Practically a complete flora of the cultivated areas in the Philippines. Descriptions, with keys, of over 1,000 species, 590 genera, and 136 families, with native names, glossary of technical terms, etc.

PHILIPPINE DIPTEROCARP FORESTS
By William H. Brown and Donald M. Mathews

Order No. 432. Paper, 150 pages, 1 map, 13 plates, and 12 diagrams, $1.00, postpaid.

In Philippine Dipterocarp Forests the authors present a very comprehensive discussion of the growth and development of dipterocarp trees and of the other elements of lowland Philippine forests.

INDO-MALAYAN WOODS
By Fred W. Foxworthy

Order No. 411. Paper, 182 pages, 9 plates, $0.50, postpaid.

In Indo-Malayan Woods, Doctor Foxworthy has brought together a large amount of accurate information concerning trees yielding woods of economic value.

A LIST OF MAMMALS OF THE PHILIPPINE ISLANDS, EXCLUSIVE OF THE CETACEA
By Ned Hollister

Order No. 418. Paper, 64 pages, $0.50, postpaid.

The distribution of each species is given, and the original descriptions are cited.

ZOLOGY—Continued

A MANUAL OF PHILIPPINE BIRDS
By Richard C. McGregor

Order No. 103. Paper, 2 parts, 769 pages, $4, postpaid.

A Manual of Philippine Birds contains in compact form descriptions of all the known species of Philippine birds. The usual keys and diagnoses of orders, families, and genera help the novice in identification.

A CHECK-LIST OF PHILIPPINE FISHES
By David Starr Jordan and Robert Earl Richardson

Order No. 102. Paper, 78 pages, $0.75, postpaid.

This list will be found a convenient guide to the synonymy of Philippine ichthyology. The nomenclature is thoroughly revised, and the distribution of each species within the Philippine Islands is given.

A CATALOGUE OF PHILIPPINE COLEOPTERA
By W. Schultze

Order No. 436. Paper, 198 pages, $1.00, postpaid.

This catalogue includes the names of all species of Coleoptera that have been recorded from a definite locality in the Philippine Islands. References to original descriptions and other important notes are given. The economic appendix includes comment on those species of beetles which are known to be injurious or beneficial to man.

PRICES ARE IN UNITED STATES CURRENCY

Orders for these publications may be sent to the BUSINESS MANAGER, PHILIPPINE JOURNAL OF SCIENCE, BUREAU OF SCIENCE, MANILA, P. I., or to any of the agents listed below. Please give order number.
