Deoxycholate-Enhanced *Shigella* Virulence Is Regulated by a Rare $\pi$-Helix in the Type Three Secretion System Tip Protein IpaD

ABRAM BERNARD
Shigella

Pathogenicity

- Spread through the fecal oral route
- Up to 90 million cases of shigellosis per year with 100,000 deaths worldwide
- 10-100 organisms needed for infection

Virulence Requires the Type III Secretion System

Type III Secretion System (T3SS) utilizes the Type III Secretion Apparatus (T3SA)

- Forms a direct conduit between bacterial and host cytoplasm
- Required for bacterial virulence
- Requires activation and maturation for invasion
- Interruption would prevent infection

Schroeder, GN, Clinical Microbiology Reviews (2008)
DOC Sensitivity
Structure Function Investigation Into IpaD Bile Salt Sensing
Mutations Restore Secretion Control and Pore Formation

Loss of secretion control
- Protein leakage

Loss of pore forming ability

Non-Invasive

Regains Secretion control
- Reduces leakage
- Inducible

Regains pore forming ability

Invasion near wild type ability
- Increase when exposed to DOC
Triple Mutation Alters DOC sensitivity
IpaB-IpaD binding is less sensitive to DOC
