

Morgan County Crop Production Costs and Returns, 2011

Kynda Curtis, Associate Professor and Extension Specialist, Department of Applied Economics

James Barnhill, Extension Associate Professor, Morgan County

Don Snyder, Professor and Experiment Station Assistant Director, Department of Applied Economics

Introduction

Sample costs and returns to establish and produce alfalfa hay, barley, and corn (silage) under flood irrigation in Morgan County, Utah are presented in this publication. This publication is intended to be a guide used to make production decisions, determine potential returns and prepare business and marketing plans. The practices described are not the recommendations of Utah State University, but rather the production practices and materials considered typical of a well-managed farm in the region, as determined by producer survey results from 2011. Costs, materials, and practices are not applicable to all situations as management and cultural practices vary among growers within the region. The “*Your Farm*” column in all tables is provided for your use.

Farm. The representative farm consists of 300 acres of land on which 160 acres are cultivated for alfalfa production, 80 acres for barley production, and 60 acres for corn silage production. The market value in 2011 was approximately \$10,000 per acre for agricultural land in Morgan County with water rights.

Crop Pricing. Five-year average pricing (2006-2010) for alfalfa hay is \$125/ton, barley \$3.48/bu, and corn (silage) \$34.60/ton (UDAF, 2011).

Owner Labor. The owner provided \$22,500 annually for the 300 acre farm, or \$75/acre.

Hired Labor. Hired labor is paid \$10/hr for an annual cost of \$6,000 for the 300 acre farm, or \$20/acre.

Irrigation System. Flood irrigation system is used for all crops.

Cash Overhead. Cash overhead consists of various cash expenses paid out during the year. These costs include property taxes, interest, office expenses, liability, property insurance, and accounting/legal costs, as well as investment/machinery repairs.

Property Taxes. Property taxes in Utah differ across counties. For the purposes of this publication, property taxes on buildings are calculated at 1 percent of the average asset value of the property. Property taxes on land should be taken into consideration, but are not included here.

Insurance. Insurance on farm investments vary, depending on the assets included and the amount of coverage. Property insurance provides coverage for property loss at .666 percent of the average asset value. Liability and crop insurance covers accidents and crop loss on the 300 acre farm at an annual cost of \$2,000.

Fuel and Lube. The fuel and lube for machinery and vehicles is calculated at 8 percent of the average asset value.

Investment Repairs. Annual repairs on all farm investments or capital recovery items that require maintenance are calculated at 2 percent of the average asset value for buildings, improvements, and equipment and 7 percent of the average asset value for machinery and vehicles.

Office & Travel. Office and travel costs are estimated at \$2,000 for an average year for the 300 acre farm. These expenses include office supplies, telephone service, Internet service, and travel expenses to educational seminars.

Accounting & Legal. Annual accounting and legal costs are estimated at \$3,000 for an average year for the 300 acre farm.

Capital Recovery. Capital recovery costs are the annual depreciation (opportunity cost) of all farm investments. Capital recovery costs are calculated using straight line depreciation. All equipment listed is new unless otherwise noted. For used machinery the price is

calculated as one-half of the new purchase price and useful life is two-thirds that of new machinery (Painter, 2011).

Salvage Value. Salvage value is 10 percent of the purchase price, which is an estimate of the remaining value of an investment at the end of its useful life. The salvage value for land is the purchase price, as land does not normally depreciate.

Average Asset Value Computation

$$\left(\frac{\text{Purchase Price} + \text{Salvage Value}}{2} \right)$$

Straight Line Depreciation Computation

$$\left(\frac{\text{Purchase Price} - \text{Salvage Value}}{\text{Useful Life}} \right)$$
