

Human-Accelerated
Biodiversity Loss
during **Climate Change**
— Threatens —
Human Health &
Food Security

by Miles Robertson, Math/Stats and Biology, CAI 5200

Ecosystems include Humans

Ecosystem:

A set of interacting organisms and their physical environment

Climate Change will Cause Destruction

Ecosystem Dynamics are Difficult to Predict

FOX

mass: 15 lbs
lifespan: 4 yrs
offspring: 6/yr

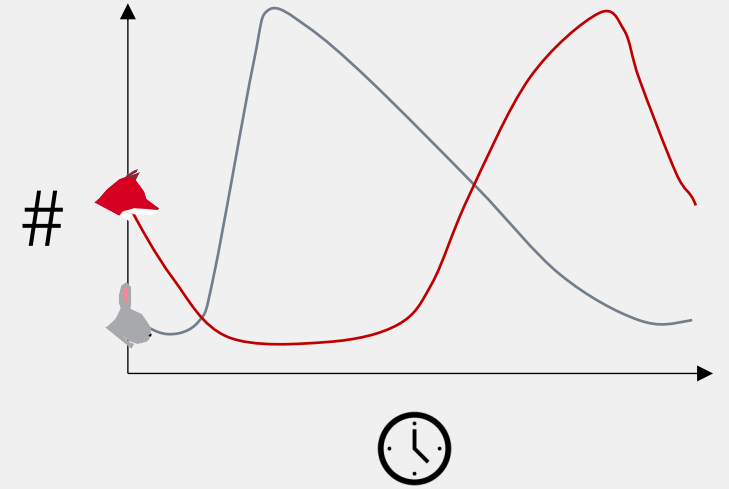

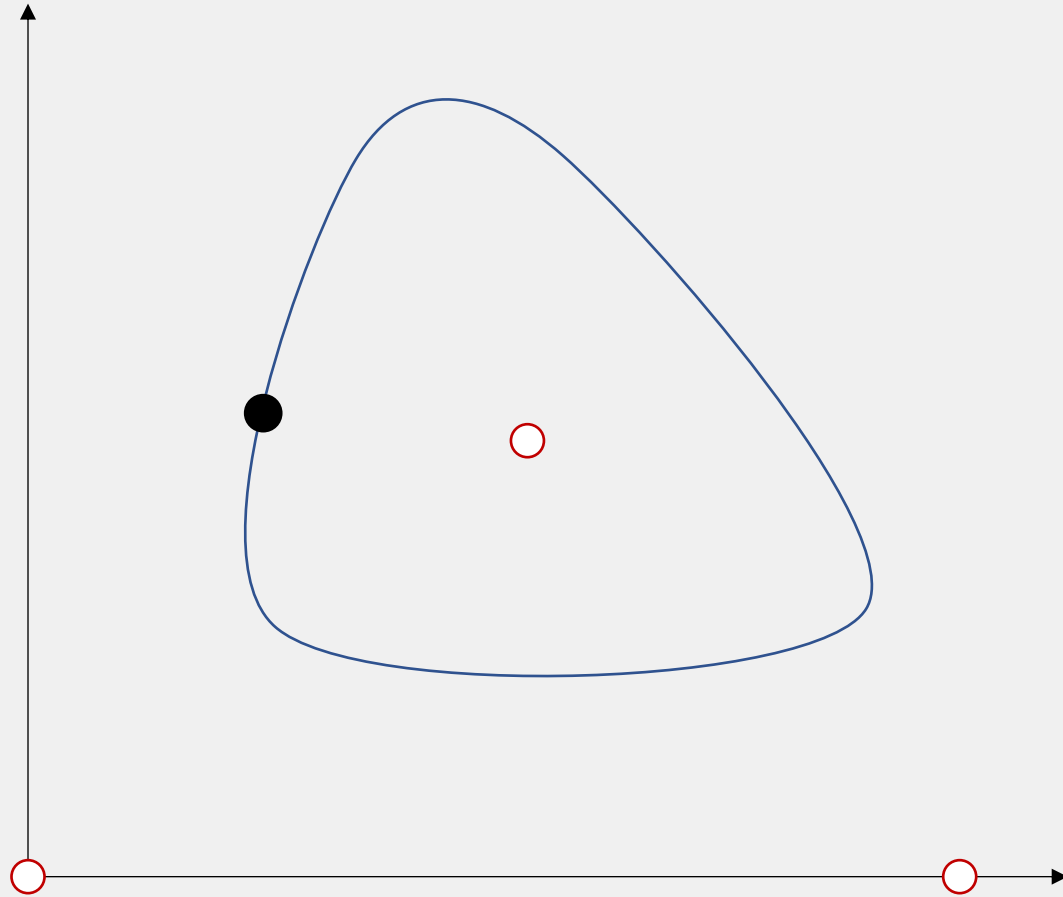

RABBIT

mass: 3 lbs
lifespan: 9 yrs
offspring: 100/yr

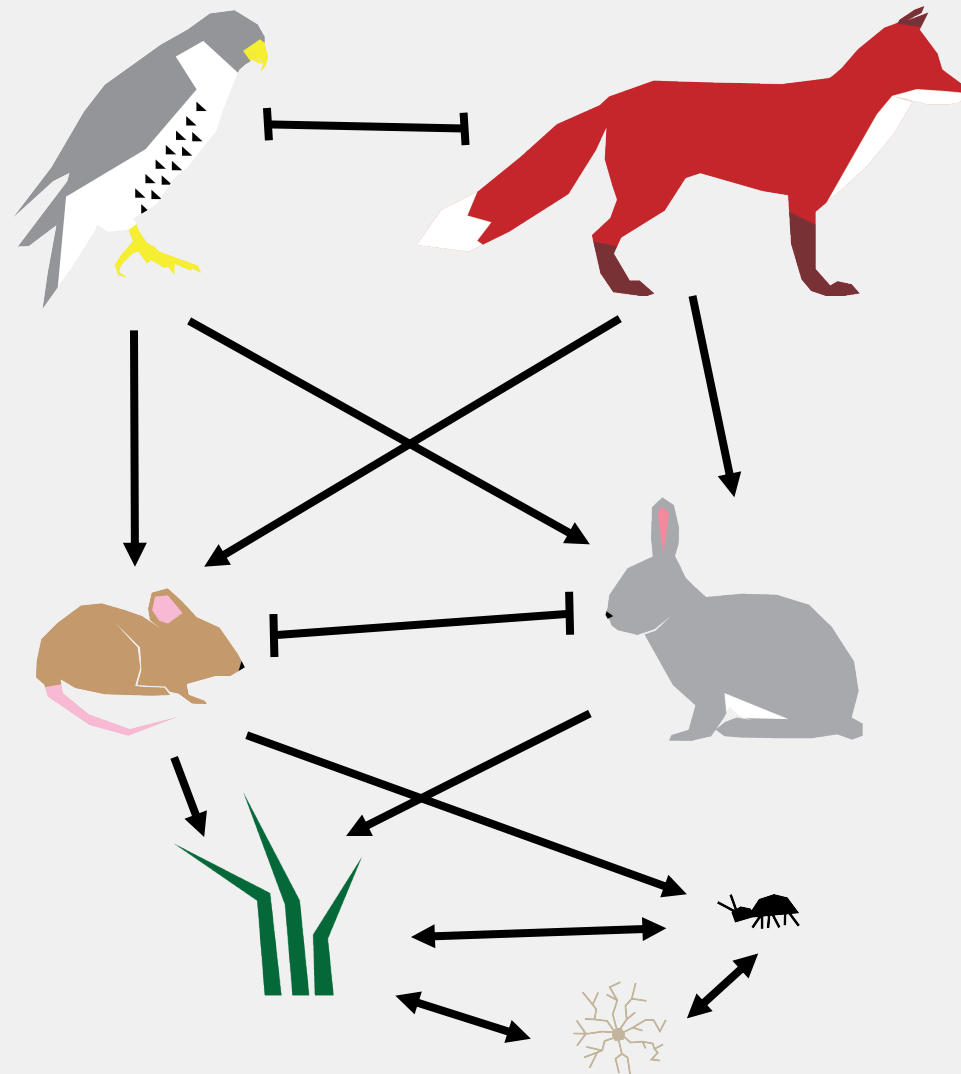

Ecosystem Dynamics are Difficult to Predict

Ecosystem Dynamics are Difficult to Predict

Biodiversity Stabilizes Ecosystems

Interspecific Biodiversity

Intraspecific Biodiversity

Ecosystems are Resilient, but not Indestructible

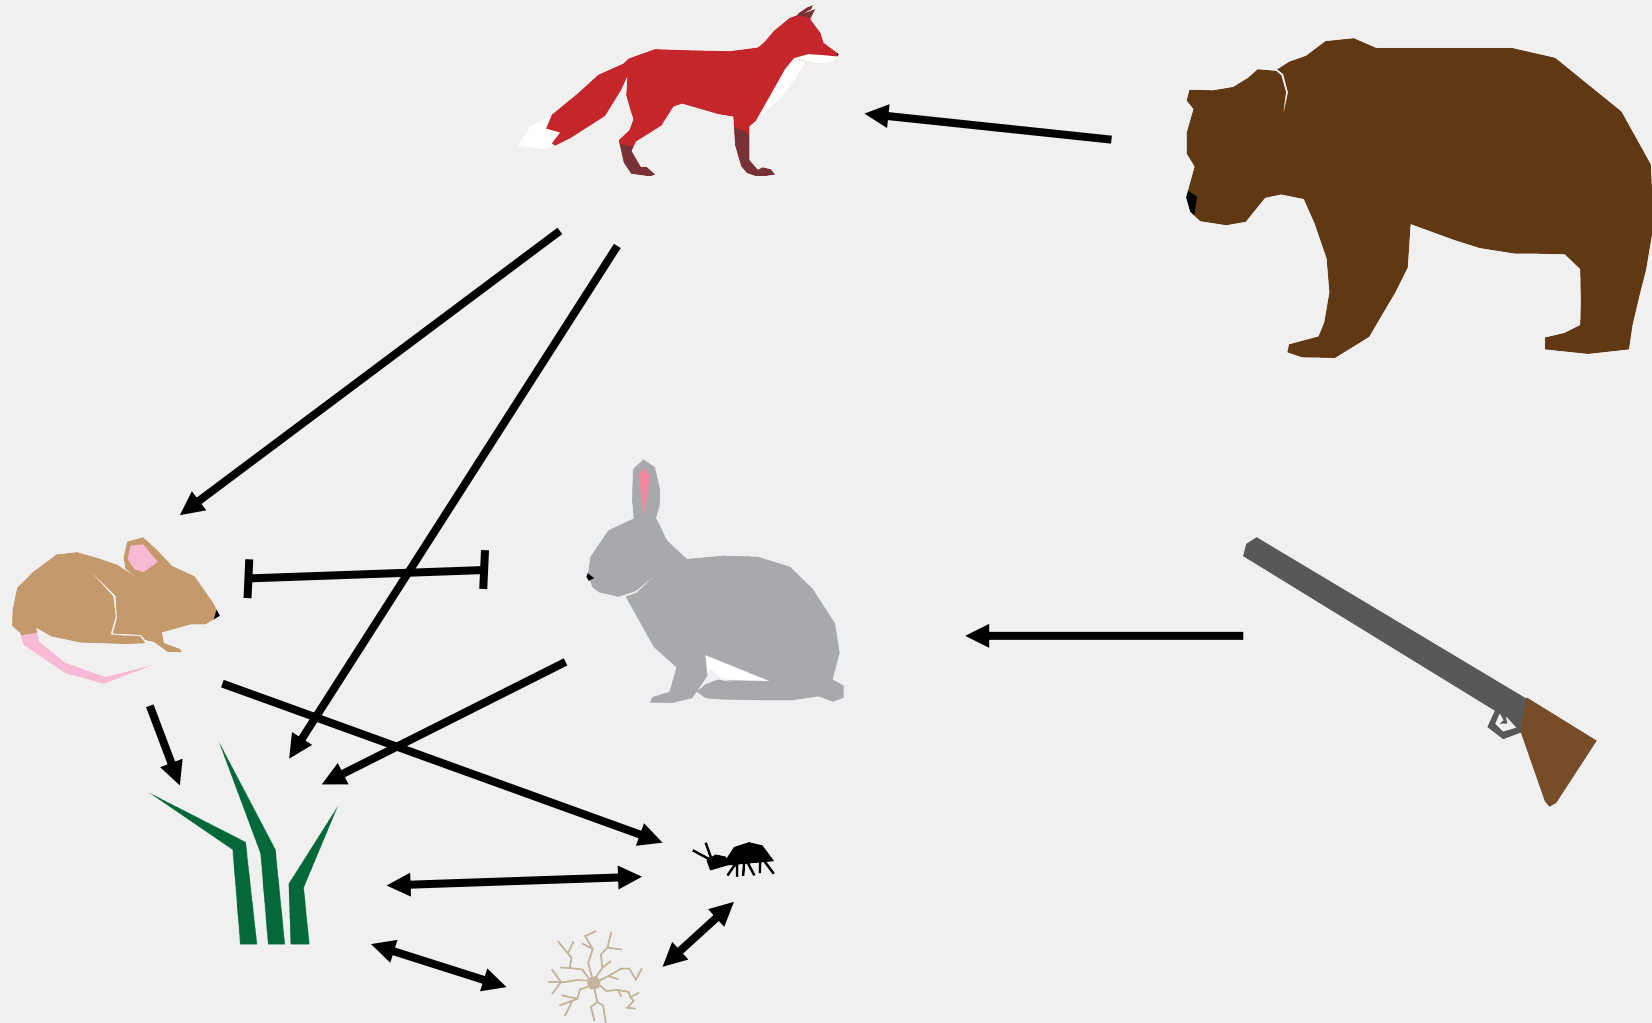

Ecosystems are Resilient, but not Indestructible

Ecosystems are Resilient, but not Indestructible

3 Case Studies of Biodiversity Loss - **Methods**

Data Sources

- Government-collected data
- Academic research papers
- Climate change projections

4R Resilience Framework

- Resistance
- Retention
- Resurgence
- Recovery

South China Sea

Biodiversity Interest:

Marine ecosystems supporting fisheries

Countries:

China, Taiwan, Indonesia, the Philippines, Thailand, etc.

Affected Population Estimate:

~2 billion people

South China Sea - Threats

82% \pm 12%

decrease in SCS
fish stock since 1950
due to overfishing

half

of worldwide fishing
vessels are in SCS

25% \pm 5%

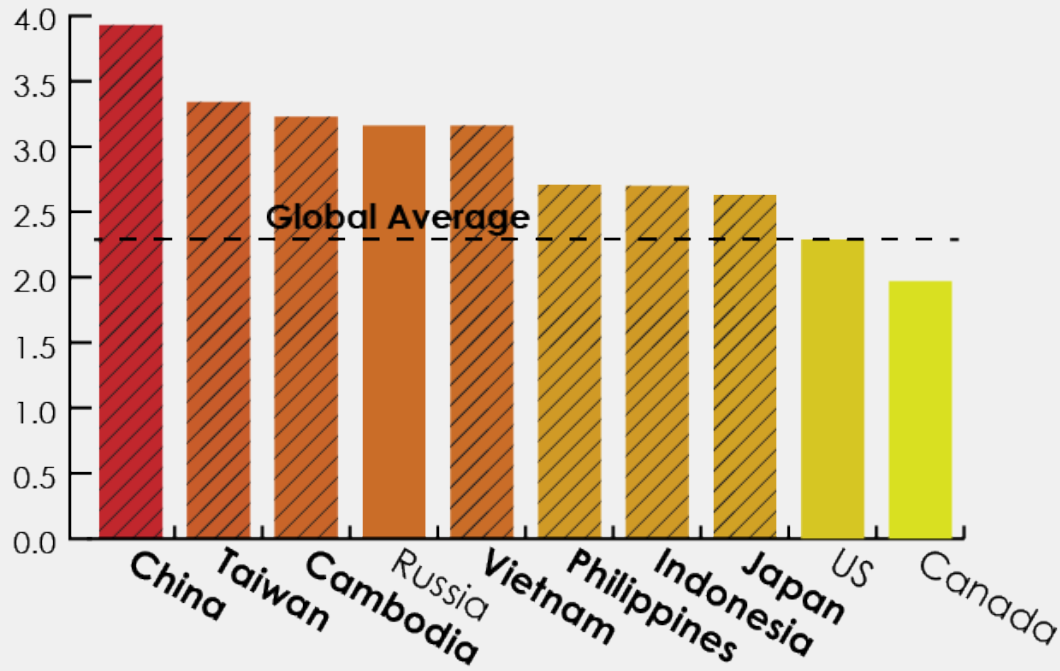

projected **biomass**
loss in SCS by 2100
due to climate change

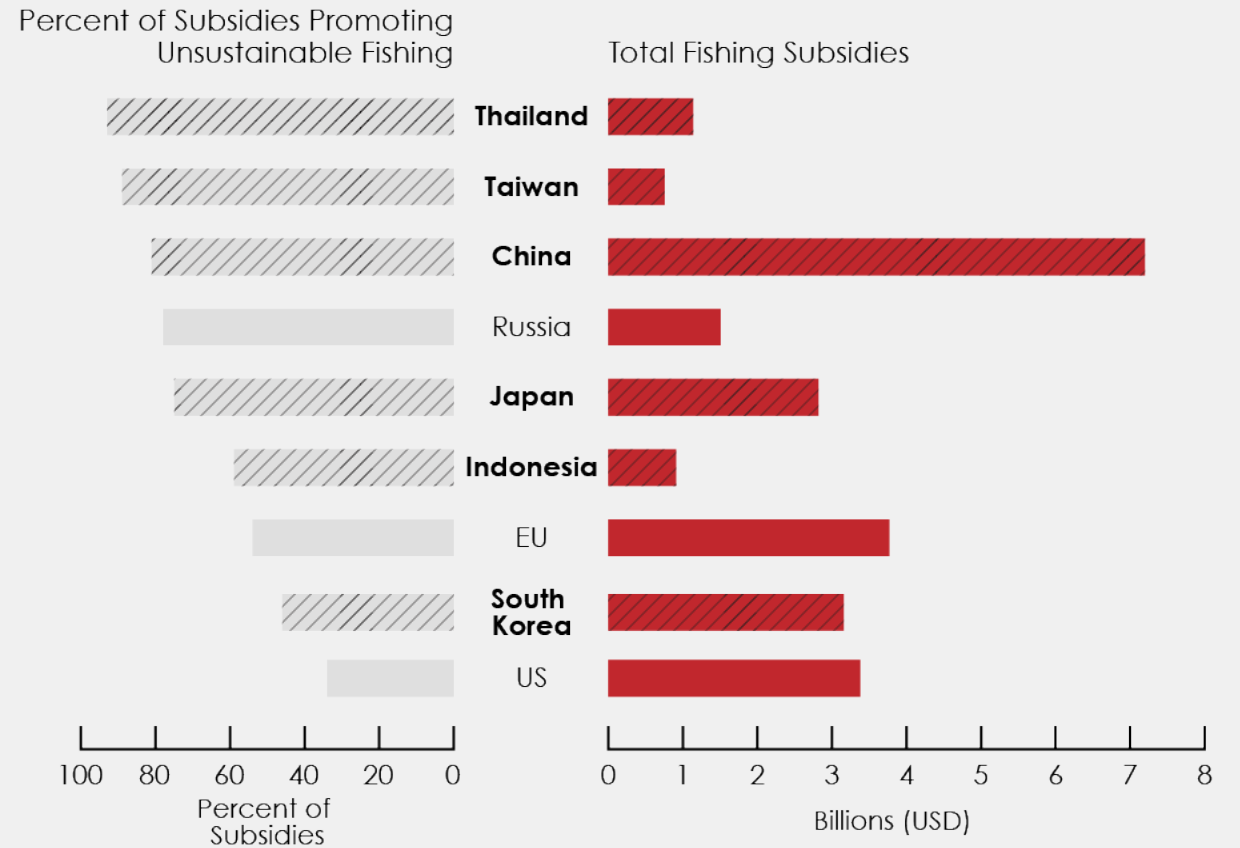

South China Sea - Resilience

Selection of Scores from Illegal Fishing Index (IUU Fishing Index, 2021)

2018 Fishing Subsidies Data (Sumaila et al, 2019)

US Corn Belt

Biodiversity Interest:
Fungal and microbial
populations in crop soil

Countries:
USA, US Export Nations

Affected Population Estimate:
~1 billion people

US Corn Belt

US Corn Belt

US Corn Belt

90% $\pm 10\%$ **leaf browning** under climate change
and low soil biodiversity combined

Amazon Rainforest

Biodiversity Interest:
Pathogen host populations

Countries:
Brazil, Colombia, Peru,
Bolivia etc.

Affected Population Estimate:
~500 million people

Amazon Rainforest

Amazon Rainforest

Amazon Rainforest

many zoonotic diseases

increase

spread when there is a decrease in the diversity of pathogen hosts

Conclusions

- Ecosystems are resilient to challenges if...
 - biodiversity is preserved
 - changes are gradual
 - challenges are sporadic
- Some human activities threaten our place in the biosphere
- Biodiversity nurturing buffers consequences of climate change
