The Internet of Satellites:
A C&DH Software Framework Built on Open Internet Standards and Software

Capable Cubesats

- **Powerful Processors with Small Form Factors**
  - Beaglebone Black, Raspberry Pi, etc.
- **Ethernet Connectivity**
  - Internal IP network
- **Open Source tools**
  - Massive user base
  - Exponentially increases speed of development
- **You can now “Fly your Laptop”**
Satellite Local IP Network

- Ethernet Switch
- Payload
- Payload
- SW Payload
- Flight Computer
- Radio
- Serial Payload
“Under the Hood” - System Architecture
System Architecture

- **Linux Base**
  - Custom Linux build tailored to the Beaglebone
  - Familiar platform for developers
  - Massive user base to provide open source tools and support
System Architecture

- **Core Bus Firmware**
  - Hardware Interface
    - “bent-pipe”
  - CCSDS Spacepacket standard
    - Ubiquitous in current flight software and groundstations
  - Lowest level interface
  - High TRL base
System Architecture

- **Python Library**
  - Open Source - On our GitHub
  - Library for interfacing with the Core Firmware
    - CCSDS Spacepackets
  - Can be used directly to build Python payload applications
    - event-driven applications
    - service based
System Architecture

- **HTTP server**
  - High Level
  - Internet standards:
    - ReSTful API
    - JSON data format
  - Exposes most common Core functionality

- **Advantages to Payload Developer**
  - Familiar protocol
  - Wide native or library HTTP support:
    - Java, Python, JavaScript, C/C++, C#, ...
  - API retains backward-compatibility through hardware upgrades
  - Data interchange is standard & intuitive (JSON)
System Architecture

- **Multiple Levels of Abstraction**
  - Low level control and direct access to the Core
  - High level interface for ease of access and development
Example Payload: Antarctic Observation

- **Mission:**
  - Support antarctic base research with aerial footage at high temporal resolution.

- **Tasks:**
  - Take pictures of area around arctic base
  - Process pictures during orbit to measure ice
  - Downlink data & satellite health when passing over ground stations in lower latitudes
Example Payload: Design

- **Hardware:**
  - Camera
  - Linux Computer for controlling camera and image processing
    - Raspberry Pi, Beaglebone Black, NVidia Tegra
  - SSD Drive for photo storage

- **Software:**
  - Pick your favorite language…. Let’s say C++
  - Open HTTP Library for communication with the Flight Computer:
    - libcurl - [https://curl.haxx.se/libcurl/](https://curl.haxx.se/libcurl/)
  - Open Source JSON library:
    - JSON for modern C++ - [https://github.com/nlohmann/json](https://github.com/nlohmann/json)
  - Open Source library for image processing:
    - OpenCV - [http://opencv.org/](http://opencv.org/)
Example Payload: Payload <--> Bus

- Check for pass over antarctic to take photos:
  - **GET /gps/state**
    - Response: {lat: 84, long: -44, altitude: 235}

- Request to point camera at targets:
  - **POST /adcs/attitude**

- Send data to flight computer for downlink on next pass:
  - **PUT /payload-01/telemetry-downlink**
    - Body: {measurement_1: 344, measurement_2: 874, …}

- Check for commands from ground to downlink raw data:
  - **GET /payload-01/commands**

- Send raw files to be downlinked:
  - **PUT /payload-01/data-downlink**
Example Payload: Payload <--> Bus

- Check for pass over antarctic to take photos:
  - *GET /gps/state*
    - Response: {lat: 84, long: -44, altitude: 235}

- Request to point camera at targets:
  - *POST /adcs/attitude*

- Send data to flight computer for downlink on next pass:
  - *PUT /payload-01/telemetry-downlink*
    - Body: {measurement_1: 344, measurement_2: 874, ...}

- Check for commands from ground to downlink raw data:
  - *GET /payload-01/commands*

- Send raw files to be downlinked:
  - *PUT /payload-01/data-downlink*
Pumpkin Mission Architecture

User Programs

Ground HTTP Server

Ground Station

Payload

Flight HTTP Server

Flight Radio

HTTP

UDP/IP

RF
Example Payload: Ground Station <--> Ground Applications

- **Same Interface on Ground**
  - Payload data pulled into cloud database for analysis
  - Command/control remote from ground stations
  - Phone alerts about satellite health, pass information, etc. sent to dish operators & mission engineers.

- **Design an App for your satellite**
Development Status

● **Beta Release Ready:**
  ○ Core Bus Firmware
  ○ Python Libraries
  ○ HTTP/ReST Server Bus - Payload

● **In early development:**
  ○ Ground station HTTP server
Conclusion

- Powerful flight computers for Cubesats are here
- Adopt web standards for easy integration
- Modular and Open Source Systems speed up development
Thanks...

- Shaun Houlihan
- Austin Small
- James Womack
- Devlyn Nelson
Questions?
Goals

● **Reliable**
  ○ Leverage as much flight heritage as possible
  ○ Compartmentalize mission specific code

● **Capable**
  ○ Fully utilize all onboard hardware
  ○ Allow access to all levels of the system

● **Compatible**
  ○ Fits into current systems seamlessly
  ○ Use widely adopted hardware/software standards

● **User friendly**
  ○ Provide multiple levels of abstraction
  ○ Enable everyone from novice to veteran developers
  ○ Open source
Typical Mission Architecture

- User Programs
  - Manual Handoff
- Command and Control Software
- Ground Station
- Payload
  - Serial, I2C, etc...
- Flight Software
- Flight Radio
  - Serial, I2C, etc...
  - RF
