What traveler, driving across Utah, has not marveled at its diversity of geography, climate and vegetation? From Joshua-trees in the Mojave Desert, to alpine meadows, to pinion-juniper forests set against the red sandstone of the Colorado Plateau, it is truly a state of contrasts.

Ideally, Utah landscapes should be designed to be adapted to local conditions and to enhance the natural beauty of the state. Unfortunately, most of our landscapes are patterned after those found in Europe or northeastern America. Such landscapes are difficult to maintain and require more resources, such as water and fertilizer, than adapted landscapes. While there is no simple recommendation that would be valid state-wide, localized guidelines can address the diversities of climate, soils, and other factors which affect plant growth.

The purpose of this series of publications is to recommend plants and landscape management procedures for various regions of the state. This edition targets the communities of Southwestern and Central Utah (Iron, Beaver, Kane, Millard, Juab, Sanpete, Sevier, Piute, Wayne, Garfield, and parts of Washington counties). These valleys are characterized by moderate to cold temperatures and short to moderate growing seasons.

Cold winters, hot summers, little rainfall, and poor soils make this area one of the state's most difficult sites for growing and maintaining landscapes. Proper landscape design and management can help prevent plant stress and death in these conditions. It also makes landscapes easier to maintain. The first step to successful landscaping is to understand the local climate and soil.

This region of Utah is characterized by moderate to cold temperatures (lows of -12 to -54°F), and moderate to short growing seasons of 74-171 frost free days. Snowfall amounts vary tremendously depending on the location. Frost-free season information is critical to successful production of fruit and vegetables, and gardens should be planned accordingly. It is also important because of the damaging effect that early and late frosts can have on some landscape plants. Equally if not more important to landscape plants, is the average minimum temperature of the region.

</table>

*The hardiness zones listed for each location are based on the mean minimum temperatures recorded from 1961 to 1990 (mean over 30 years of each year’s lowest temperature) and the absolute lowest temperature recorded during that time. Moroni, for example, has a zone 5 based on its mean minimum temperatures and a 4 based on its all-time low between 1961 and 1990. The advantage of the zones in this table is they are based on local weather station data rather than interpolating from a large-scale map. See various gardening books or go to extension.usu.edu/forestry/HomeTown/Select_HardinessZoneTable.htm or www.usna.usda.gov/Hardzone/ for more information on USDA hardiness zones.
“Cold hardiness” refers to a plant’s tolerance to winter cold. A cold hardiness map, published by the USDA in 1990, lists hardiness “zones” for the entire United States. Southern and central Utah encompasses zones 3 to 6 (-10°F to -40°F average minimum temperatures). The USDA map can give misleading information in Utah because of rapid changes in elevation. It is also possible to have occasional years with extreme winter cold that may cause plant damage beyond what would be expected based on the hardiness map. The data above provide more detailed climate characteristics for communities and locations in the southwestern and central part of the state. There can be even more local effects (called microclimates) that are the result of topography, canyons, walls, buildings, and courtyards. Cold hardiness must be a major consideration in choosing any landscape plant.

Climatic records also tell us how much moisture enters the landscape as precipitation, and how much water is lost from the landscape. Because of rain shadow effects and elevation, precipitation can vary from 5.3 inches in Antimony to 30 inches annually at Blowhard Mountain. Water lost from a landscape through transpiration by plants or evaporation from the soil surface is called evapotranspiration or ET. Climatic data for the month of July estimates that a turf area in a cool spot, such as Panguitch, would use about 0.16 inches of water per day (4.7 inches per month), while warmer spots, such as Delta, may use up to 0.19 inches per day (5.6 inches per month). These values are estimates only, and are influenced by local climatic conditions. Cool summer temperatures at high elevations mean that less water is needed for irrigation. However, this does not mean water must not be conserved. Many of the communities within this classification are restricted in the amount of water available to them, so water must be used wisely.

THE LANDSCAPE ENVIRONMENT - SOIL FACTORS

Soils within this region fall within the broad classification of being cold to moderate in temperature, and generally dry. Soil textures include loam, clay loam, fine sand, fine sandy loam, and others. Some soils in this area may contain excess salt, which creates problems in many landscape situations. It is important to remember that even excellent native soils are usually reduced in quality during construction. Construction often results in the mixing of subsoils with topsoil, compaction, and contamination of the soil with debris and chemicals. Compaction is a very common problem and is serious because it restricts root growth, reduces water infiltration, and limits aeration.

Plant growth and ease of maintenance are improved immensely by high quality soils. Landscape soil quality can be improved by keeping it clean during construction, tillage to reduce compaction, and amending with fertilizers and organic matter. To amend soils correctly requires an understanding of the following characteristics.

**Soil texture:** This refers to the percentages of sand, silt, and clay in a soil. Sandy soils drain quickly and retain little water or nutrients. Clay soils consist of much smaller particles and have less drainage, but better nutrient retention than sandy soils. Soils with appropriate balances of sand, silt, and clay are described as loamy. Loam soils, or close relatives such as clay loams or silt loams, are the best soils for plant growth.

**Soil structure:** Structure refers to the degree to which small soil particles clump together, forming both large and small pores throughout the soil. This clumping aids water and air movement in the soil because water and air can move freely through the large pores. At the same time, the smaller pores within the aggregates hold water for plant use.

**Soil organic matter:** Organic matter is beneficial in soil because it decomposes to provide plant nutrients. Organic matter also improves water infiltration, drainage and retention in the soil, largely due to its ability to improve soil structure. Manure, compost, leaves, and grass clippings are sources of soil organic matter.
Nutrient status: The nutrient status of the soil refers to the amount of nutrients such as nitrogen, phosphorus, and potassium in the soil. These nutrients and several others are essential for proper plant growth. If nutrients are limited then plant growth suffers because of deficiencies. On the other hand, excessive levels of nutrients or other compounds such as sodium chloride can result in salty soils. Saline soils are difficult for plants to grow in because high levels of salts make it hard for plant roots to absorb water.

Soil pH: This refers to the acidity or alkalinity of the soil. It is important because the pH of the soil affects the availability of mineral nutrients to plants. For example, Utah soils have high levels of iron, an essential mineral. However, due to the high pH of these soils, the iron present is not readily available for plant growth.

The most effective way to determine a soil's characteristics is to have a soil test done. Soil testing is done by commercial laboratories, or through agencies such as the Soil Testing Laboratory at Utah State University (435-797-2217). Instructions and sampling kits for soil tests are available at county Cooperative Extension offices.

MANAGING THE LANDSCAPE ENVIRONMENT - WATER MANAGEMENT

Summer landscape irrigation requirements are primarily met through irrigation. A problem common to arid regions is the tendency for over-irrigation, which wastes water and can damage many plants. Water supplies in Utah are limited, and will become more so as demand for water continues to increase. Conservation of water is important from both environmental and proper plant management perspectives. Remember though, limited water does not mean that landscaping must be limited. It is possible to retain beautiful and functional landscapes while conserving water. There are several things that can be done to conserve water in the landscape.

1. Planning: Planning for water conservation can provide many ways to save water within a highly functional and desirable landscape. Factors that should be planned for in the design include selecting appropriate plants, installing a well-designed irrigation system, proper preparation of the soil before planting, landscape weed control, and efficient maintenance. Information on plant materials and designs for water conservation can be obtained from this publication and the many references listed in the bibliography. Visits to local parks, gardens, golf courses and other landscaped areas can also provide a wealth of information.

2. Irrigation systems: Proper design and use of irrigation systems can provide substantial water savings in the landscape. Proper design insures that irrigation water is applied uniformly to the landscape. Uniform application prevents over-watering of large portions of the landscape when the system is left on long enough to get that one stubborn dry spot green. Design can also specify the use of water saving systems such as drip irrigation.

Even the most perfectly designed system will waste water if not managed correctly. Fortunately, there are a number of techniques which can be used singly, or together, to conserve water while irrigating.

- Know how much water you are applying. Irrigation should be applied based on quantity of water, not the length of application time. Sprinkler system application rates can be determined by placing several straight sided containers (soup cans) in the landscape and measuring the water applied in a given time period. This information also gives some idea of how uniformly water is being applied.

- The landscape should be designed so that plants are grouped according to irrigation requirements. With such a design, each control station can be set to provide the appropriate amount of water for the plants within that station. For example, a station
covering the north side of a home will require less water (per square foot) than one on the south side.

- The amount of water applied at any one time should be sufficient to moisten the entire root zone. Sandy soils will require less water to do this than clay soils. Shallow soils will also require less than deep soils. The best way to determine depth of irrigation is to use a soil probe (moisture probe, long screwdriver or soil corer) to determine how far the water has penetrated the soil. More information on this technique can be found in the Utah State University Fact Sheet entitled: Water Wise Landscaping: Monitoring Soil Moisture with Probes (http://extension.usu.edu/publica/gardpub2.htm). It may be necessary to apply water in a series of frequent, short applications to prevent surface runoff while thoroughly moistening the soil profile.

- Irrigate when plants need it, not on a predetermined day of the week. There are a number of observational techniques that can be used to determine when to irrigate. The easiest is to observe the landscapes and watch for signs of water stress in plants. Water stress usually shows up first in turf, and is characterized by a change in color from a bright green, to a dull blue-green. Dry turf will also show foot prints after it is walked on. There may be other plants in the landscape that show water stress before anything else, and they too can be used to schedule irrigation. If water is applied soon after stress appears, there is usually no harmful effect to the landscape. Irrigation scheduling can also be based on ET.

3. **Plant hydrozones:** Grouping plants together according to similar water requirements avoids wasteful over-watering and encourages proper growth. For many water efficient plants, there is such a thing as too much water. This guide provides recommended levels of watering as a general guide to “zone” planting. It is important to realize that there are not any magic numbers available which say exactly how much water should be applied to the landscape for any given plant. Water needs are dependent on the soil type, weather conditions, plant material, and the amount of competition with weeds or other desirable plants. The ratings given in any publication are simply guidelines.

4. **Use mulches:** One of the best things that can be done with any landscape is to use mulches of organic matter. It is hard to go wrong when adding such material to the soil, especially in the desert soils of Utah where organic matter is often very low. Mulches keep soil temperatures lower and reduce surface evaporation, thus holding the water near roots longer. Mulches suppress weed growth, reducing competition with desirable plants. They also decompose over time and provide needed organic matter to the soil.

5. **Proper use of turf:** There is a constant debate on how much water turf uses compared to other plants. Currently, researchers are looking for turfgrasses that can do well in low irrigation situations. Since turfgrasses are actively growing all summer long, they tend to use more water than other plants. For many types of activities, there is no good substitute for turf, so eliminating turf from the American landscape is usually not an option. However, reducing the amount of turf can save water. For instance, if the only time a turf area is walked on is when it is mowed, then it may be prudent to consider an alternative. Perennials can be more water efficient and offer the benefit of color. Shrub beds installed with weed barriers can be very attractive and very low maintenance. There are also nontraditional turfgrasses, such as buffalograss, which can survive with little supplemental water. However, such grasses do not function the same as bluegrass in the landscape.

6. **Control weeds:** The ideal water conserving landscape loses no water through evaporation from the soil or use by weeds. Evaporation can be controlled by mulches. Weeds can also be controlled by mulches, and by cultivation and herbicides. Remember, label directions
must be followed when using herbicides in landscapes. A good reference is the Utah Horticultural Weed Control Handbook available through Cooperative Extension.

**MANAGING THE LANDSCAPE ENVIRONMENT - SOIL MANAGEMENT**

One of the main causes of landscape problems is inadequate soil preparation. Landscape soils are often compacted or contaminated by construction practices. If these problems are not corrected, plant growth will suffer for years. There are many simple practices that can dramatically improve soils damaged by construction.

When preparing a soil for planting, the first step is to reduce compaction by deep tillage or ripping of soil. This insures appropriate drainage and aeration. This cultivation should be done to the subsoil following construction and before the addition of top soil. The depth of cultivation should be 12-18 inches, and only needs to be enough to break up compacted soil layers. Finer tillage and grading can be done after topsoil is added.

Organic matter can also improve soil characteristics. Addition of organic matter is beneficial because it may temporarily reduce the pH (if acidic materials are used), improve nutrient and water retention, and insure good structure and aeration. Organic matter is best when used to modify an entire area rather than just a planting hole. When amending with organic matter, the best method is to spread a layer on the surface of the topsoil and then cultivate it into the soil. It is usually not appropriate to amend a soil with sand or clay. Such practices may damage the soil more than they improve it.

Two common problems in this area are alkaline soils (high pH) and salinity. Lowering soil pH is difficult for large areas, and is very expensive for an entire landscape. The best solution is to choose plants adapted to the existing pH, rather than trying to change the pH to support non-adapted plants. Irrigation with high quality water (low salts) in soils with adequate drainage controls most soil salinity since salts move freely with soil water. Improve drainage by reducing compaction and adding organic matter to the soil, or by the installation of drain tiles in areas with severe problems. Salinity problems can be reduced by applying an extra 10% of water to help flush salts down past the root zone. It is also possible to select plants that are salt tolerant.

**MANAGING THE LANDSCAPE ENVIRONMENT - LANDSCAPE PLANT SELECTION**

The answer to many landscape problems is as simple as selecting appropriate plants. Plants that are native or adapted to the local environment can thrive under minimum maintenance, while non-adapted plants often will not survive the soil and climatic conditions.

Cold tolerance is the first criterion in selecting landscape plants. Plant irrigation requirements and other factors are less critical because we can economically provide water, fertilizers, and pesticides. However, providing supplemental heat for landscape plants is too expensive to be an option. For some reason, people tend to choose plants that are at the very limit of their hardness capability. The result of such selections is that many of these plants are injured or killed outright during periodic cold spells. To avoid the discouragement of seeing a carefully nurtured 10-year-old tree die, it is much better to select plants that are hardy for the zone they are grown in. Most plant material publications and catalogs are good sources of hardness information.

While hardiness is the most critical aspect of plant selection, other factors are also very important. In a water conserving landscape, plants should be selected that tolerate minimum irrigation and extended dry periods. In areas with high pH soils, plants should be chosen that are
not susceptible to iron chlorosis. Plants should also be chosen based on their resistance to local disease and insect problems. For example, plants such as European weeping birch, silver maple, rhododendrons, and others are not recommended because of serious problems that occur with them in the landscape.

Some think that only native plants should be used in drought tolerant landscapes. While many native plants function extremely well as landscape plants, it is important to realize that some natives may not be adapted to the site in question. Just because a plant is native to Utah does not mean it is native to all of the habitats in Utah. In addition, there are many introduced plants that function as well as, or better than, some natives in low maintenance landscapes.

The following tables are lists of plants that are suitable for much of Southwestern and Central Utah. Plants are classified as trees, shrubs, herbaceous perennials, and grasses. Each plant is listed with common and botanical names, and a host of characteristics. While not comprehensive, these lists are a good place to start when choosing plants for a landscape, or when sitting down with a landscape architect. In these lists, ‘zone’ refers to the plant hardiness zone, and water refers to relative water requirements for acceptable growth. Water requirements are based on a scale of 0-3, with the definitions as follows:

- **0**: No supplemental water is required after plants are established.
- **1**: At least 1-inch of supplemental water per month may be required after plants are established.
- **2**: At least 1-inch of supplemental water every two weeks may be required after plants are established.
- **3**: At least 1-inch of supplemental water each week may be required after plants are established.

---

**TREES**

**Abies lasiocarpa - Subalpine Fir**

Native, evergreen tree occurring at elevations of 6500-10,000 feet. This tree is narrowly pyramidal and grows to 60’-80’ tall. Only for cool, moist environments.

**Abies concolor - White Fir**

Native, evergreen tree occurring at elevations of 6000-8000 feet. Broadly pyramidal, to 80’. The needles have a white or frosty appearance. Currently available in the nursery trade. One of the best firs for landscaping.

**Acer campestre - Hedge Maple**

Native, deciduous; relatively small green leaves; growth to 30’ x 30’. Tolerant of soil alkalinity; no serious disease or insect problems. A nice small maple.

**Acer ginnala - Amur or ginnala maple**

Native to central and northern China, Manchuria, and Japan. Moderately shade tolerant. Many varieties are available commercially that vary from small shrubs to small trees. The main problem with this species in Utah is occasional chlorosis on high pH soils. Fall color can be excellent.

**Acer glabrum - Rocky Mountain Maple**

Native, deciduous, small tree growing rapidly to 20’ x 15’. Green leaf color changing to yellow to orange in fall; does well in sun or shade. Grown easily from seed, but hard to transplant. Stays shrub-like on poor sites.
Acer grandidentatum - Big Tooth Maple
zone 3 water 1-2
Small, deciduous tree with bright fall colors of yellow to orange and red. Slow growth to 30' x 20'; requires well-drained soils and full sun. Easily grown from seed, transplants well if container-grown. Thought to be a close relative of the sugar maple.

Acer negundo - Boxelder
zone 2-9 water 1
A large, native, deciduous tree common to riparian areas throughout Utah. Rapidly growing and weak-wooded. Female trees are susceptible to the boxelder bug. Not the best choice, but in wet sites selected cultivars may be a good option.

Acer platanoides - Norway Maple
zone 3-7 water 3
Deciduous; green to purple leaves depending on cultivar; very dense shade; moderate growth rate to 50' x 40'; full sun; tolerant to soil type if well-drained; pH of 6-8. Tolerant of air pollution. Problems with aphids, verticillium wilt, and leaf scorch; somewhat weedy.

Acer pseudoplatanus - Sycamore Maple
zone 5-7 water 2
Deciduous; dark green leaves with little fall color; moderate growth rate to 45' x 35'; full sun to partial shade; tolerant to a wide range of soils if well-drained; Tolerant of salt and wind.

Acer tataricum - Tatarian Maple
zone 3-8 water 2
Deciduous; small tree (20' x 20'); slow-moderate growth rate; often multi-stemmed; wide range of fall colors; adaptable to a wide range of conditions and somewhat drought tolerant when established. Few disease or insect problems.

Aesculus hippocastanum - Horsechestnut
zone 3-8 water 2
Deciduous tree, growing to 50’-70’. Very showy flowers. It has a slow growth rate and is susceptible to leaf scorch. Aesculus x carnea (Red Horsechestnut) may be more scorch tolerant. Has large, inedible seeds.

Ailanthus altissima - Tree of Heaven
zone 4-8 water 1
Deciduous tree growing to 40’-60’. Attractive dark, green leaves. Best used as an alternative for moist, poorly drained soils. Has the ability to fix nitrogen.

Alnus glutinosa - European Alder
zone 3-7 water 3
A native, deciduous tree or shrub. Occurs in riparian areas in mountainous regions throughout the state. Selected varieties are available. An excellent choice for cold, wet environments.

Alnus incana - Mountain Alder
zone 1-6 water 3
Deciduous, multi-stemmed small tree which grows rapidly to 35' x 15'. Occurs naturally as a riparian plant. Multiple stems and copper-colored bark provide nice winter appearance. Transplants easily. Should not be confused with Betula nigra a non-native River Birch.

Catalpa speciosa - Northern Catalpa
zone 4-8 water 1
Deciduous, large-leafed tree; showy white flower; long fruit pod; moderate growth to 40'H x 20'W; partial shade to full sun; tolerant of wide ranges in soils and pH’s of 6-8. Withstands hot, dry conditions. Susceptible to verticillium wilt, but no major problems.
**Celtis occidentalis** - Common Hackberry
zone 2-9 water 1
Deciduous; coarse, green leaves with yellow fall color; ridged, corky bark; moderate grower to 40' x 40'; full sun; tolerates a wide range of soils with pH of 6-8. Largely pest free except for leaf nipple gall, a cosmetic insect problem on leaves.

**Celtis reticulata** - Netleaf Hackberry
zone 4 water 0
A deciduous native. Common to riparian areas of southern Utah. Native throughout Utah. Also susceptible to nipple gall.

**Cercis canadensis** - Eastern Redbud
zone 3-9 water 2
A small, flowering, deciduous tree growing to 20'-30' tall. The flowers are a distinct magenta and open before the leaves. Widely adaptable, though does require well drained soil. A member of the legume family.

**Crataegus douglasii** – Black or Douglas Hawthorn
zone 2-8 water
Native, small (25'), deciduous tree occurring in riparian areas at elevations of 4000-8400 feet. It has small, white flowers and 1/2-inch black fruit. Like most other hawthorns, it is quite thorny.

**Crataegus crusgalli** - Cockspur Hawthorn
zone 3-8 water 1
A small, flowering, deciduous tree that grows to 20'-30'. Small white flowers followed by persistent red fruit. A slow growing tree. Large thorns are a significant concern in some situations but a thornless variety exists (var. _inermis_).

**Crataegus phaenopyrum** - Washington Hawthorn
zone 3-8 water 2
A 25'-30' tall flowering tree. Broadly rounded form with dense, thorny branches. White flowers followed by 1/4-inch diameter persistent fruit.

**Elaeagnus angustifolia** - Russian-Olive
zone 2-7 water 1
Deciduous; silvery-grey foliage; fast growth to 20' x 20'; full sun; tolerant of most soil conditions including high pH and salts. Susceptible to _verticillium_ wilt. Useful in extremely difficult situations, but invasive. Check local weed ordinances.

**Fraxinus pennsylvanica** - Green Ash
zone 3-9 water 2
Deciduous; green, compound leaf with yellow fall color; fast growth to 40' x 30'; full sun. Tolerant of salt, high pH, poor soils. Select seedless varieties only. Susceptible to Lilac borer which can cause significant damage. 'Patmore' is a harder selection.

**Ginkgo biloba** - Ginkgo/Maidenhair tree
zone 3-8 water 1
Deciduous; green leaf with yellow fall color; slow to establish with moderate growth rate to 50' x 30'; full sun; adaptable to soil conditions, air pollution, heat and salts. Does well in urban conditions. Avoid extremely high pH conditions. No insect or disease problems. Use male cultivars (no fruit).

**Gleditsia triacanthos var. inermis** - Thornless Honeylocust
zone 3-9 water 1
Deciduous; green compound leaf with small leaflets; fast growth to 40' x 40'; full sun; tolerant to high pH and salt. Provides light shade, no heavy leaf litter. Susceptible to midge pod gall and _thironectria_ canker.

**Gymnocladus dioicus** - Kentucky Coffeetree
zone 3-8 water 1
Deciduous; large green doubly pinnate leaves; slow to establish and grow to 60' x 40'; full sun; adaptable to soil conditions, but prefers deep loam. Tolerates urban conditions, no serious diseases or insects. Good tough tree.

**Juniperus scopulorum** - Rocky Mtn. Juniper
zone 2-7 water 0
Evergreen native; bluish-green foliage; slow growing to 30' x 3-10'; size dependent on variety; full sun; tolerant to wide range of soil conditions if well drained. Good screen for harsh sites. May suffer root rot if over irrigated. Many cultivars.
**Juniperus virginiana** - Eastern Redcedar
 zone 2-9 water 0
 Evergreen; moderate growth to 40’ x 10’; full sun; soil and pH adaptable if well-drained; salt tolerant. Tough plant for screening and naturalizing. No serious disease or insect problems. Many cultivars.

**Koelreuteria paniculata** - Goldenrain tree
 zone 5-9 water 1
 Deciduous; green, compound leaf; yellow fall color; yellow flowers in mid-summer followed by conspicuous seed pods; moderate growth rate to 30’ x 30’; full sun; soil and pH adaptable. Tolerant of harsh, urban conditions. No serious insects or diseases.

**Larix decidua** - European Larch
 zone 2-6 water 3
 Native to the mountains of northern and central Europe; does well in Utah with a moderate growth rate and is quite cold-tolerant; prefers moist soils; shade intolerant. This is a beautiful tree with great, golden fall color. Deciduous character is interesting but not everyone likes its winter appearance.

**Malus species** - Crabapple
 zone 2-8 water 2
 Deciduous; green to red leaves; a wide variety of forms, sizes, flower color; and fruit size and color. Truly one of the hardiest flowering trees available. Adaptable as to soil type if well-drained; full sun. Over 200 cultivars in the trade.

**Morus alba** - White Mulberry
 zone 4-8 water 2
 Deciduous; green leaves; fast growing to 30’ x 30’; full sun to light shade; tolerant of most well-drained soils, air pollution, and salt. Weak wood and short lived. Use only fruitless cultivars.

**Picea abies** - Norway Spruce
 zone 2-7 water 2
 This spruce is distinguished from the more common Colorado blue spruce by its drooping branchlets, though there are many cultivars with many different forms. Medium to fast growth rate to 40’-60’. Readily transplanted. Spruce Ips bark beetle can be serious pests on water-stressed plants.

**Picea engelmannii** - Engelmann Spruce
 zone 2-5 water 1
 A native conifer occurring at elevations of 8,000-10,400 feet. Only use on cool-moist sites. Spruce Ips bark beetles can be serious pests on water stressed plants.

**Picea glauca** - White or Blackhills Spruce
 zone 2-6 water 2
 Native in Black Hills, northern Lake States, northeastern U.S., and throughout Canada and Alaska; but not in Utah. Slow growing. Prefers moist sites with good soil, but fairly adaptable. Shade tolerant. Seldom planted in Utah (except for dwarf Alberta spruce), but a very desirable landscape tree. Narrow-crown and short needles make it interesting. Dwarf Alberta spruce (P. glauca 'Conica') is a commonly available cultivar that is overused in many landscapes.

**Picea pungens** - Blue Spruce
 zone 2-7 water 3
 Evergreen native; green to blue foliage; slow growing to 40’ x 15’; full sun. Must account for eventual size of this tree when planting in landscape. Spruce gall adelgid is mainly a cosmetic problem. Spruce Ips bark beetles can be serious pests on water stressed plants.

**Pinus edulis** - Pinyon Pine
 zone 2 water 0
 Evergreen native; gray-green, double needled pine; slow growing to 20’ x 15’; full sun; tolerant to well-drained, high pH soils. No serious disease or insect problems. Has edible pine nut.

**Pinus longaeva** - Bristlecone Pine
 zone 4-7(Dirr) water 1
 Native, slow growing evergreen. With a maximum height of 8’-20’, it is an excellent small pine for use in landscapes as an accent or rock garden plant. Few, if any, pests.
**Pinus nigra** - Austrian Pine  
zone 4-7  
Evergreen; dark green, long needles; moderate growth rate to 45' x 25'; full sun. Tolerant of city conditions, soils, heat, and alkalinity. No serious insect or disease problems.

**Pinus sylvestris** - Scotch Pine  
zone 2-8  
Evergreen; relatively short needles; moderate growth to 40' x 20'; full sun. Soil tolerant if well-drained. Unique form and color. No serious insect or disease problems.

**Platanus x acerifolia** - London Planetree  
zone 4-8  
Deciduous; large, green leaves; no fall color; decorative scaling bark; moderate growth rate to 70' x 70'; full sun. Tolerant of soil type, air pollution, and pH. Problems with canker, anthracnose, and frost cracking. Choose selected cultivars.

**Populus alba 'Bolleana'** - Bolleana Poplar  
zone 3-8  
Deciduous; green leaves with white underside; columnar in form; fast growing to 40' x 15'; full sun; tolerant to high pH soils, air pollution, and salt spray. Suckers. Good for a rapid growing screen or windbreak, but susceptible to many insects and diseases.

**Populus deltoides** - Eastern Cottonwood  
zone 3  
Deciduous; large green leaves with yellow fall color; very fast growing to 70'-90' x 50'; full sun; tolerant to high pH soils. Good for a rapid growing shade tree in areas with ample room. Weak wooded, susceptible to multiple pests.

**Populus tremuloides** - Quaking Aspen  
zone 3-7  
A native, deciduous tree occurring in montane regions throughout the state. Initially fast growing. Not recommended for warmer valleys because of borers, suckers, and failure to produce desired white stems. May be an option for cooler mountain valleys. Yellow fall color.

**Prunus virginiana 'Canada Red'** - Canada Red Chokecherry  
zone 2  
Deciduous, small tree/shrub with maroon red foliage; grows to 20' x 10'. Red fruit in mid-summer. Requires well-drained, aerated soils. Will sucker.

**Pyrus calleryana** - Callery Flowering Pear  
zone 5-8  
Deciduous; small, formal tree with moderate growth to 30' x 20'. White flowers in spring with no fruit. Adaptable to varying soil types. Narrow crotch angles lead to breakage. No serious insect problems, though fire blight can be severe.

**Quercus gambelii** - Gambel's Oak  
zone 2  
Deciduous, native oak; green leaves with brown fall color; slow growing to 20' x 15'; full sun; tolerant of high soil pH, but must have well-drained soils. Susceptible to a number of native pests including the formation of galls.

**Quercus macrocarpa** - Bur Oak  
zone 3-8  
Deciduous, dark green leaves with yellow to brown fall color. Slow growing to 70'-80'. Full sun. Tolerant of high soil pH. Produces large acorns.

**Robinia x ambigua** - Idaho Flowering Locust  
zone 3-8  
Deciduous, pinnately compound leaves; moderate to fast growth to variable height and width (40' x 40'); needs well-drained soil; full sun. Tolerant to urban conditions. One of the few trees to bloom in mid-summer. Good leaves and flowers, somewhat messy. Prone to cankers on stressful sites.

**Syringa reticulata** - Japanese Tree Lilac  
zone 3-7  
Deciduous; green foliage; no fall color. Moderate growth to 20' x 15'. Needs well-drained soil and full sun. Is pH tolerant. Resistant to lilac borer and powdery mildew that occur on common lilac. Flowers in May-June.
**Thuja occidentalis** - Northern Whitecedar
zone 2-8  water 2
Native to northeast U.S., Lake States, Appalachian Mountains, and southern Canada. Not a true cedar. Medium to fairly large tree, medium to slow growth. Often found in swampy areas. Intermediate shade tolerance. More commonly planted in Utah in the past than now, though these are very desirable trees. Many different crown forms are available, from shrubby, to large pyramidal, to weeping. Good as hedge, visual screen, windbreak, or as specimen trees. Cold hardy but may need protection on harsh, dry, windy sites. Does not like extreme heat and dry conditions. Few insect or disease problems.

**Tilia americana** - American Linden
zone 2-9  water 2
Large, deciduous tree (60'-80'). Flowers are fragrant and bloom in June. May be too large for many landscapes. ‘Redmond’ is a common cultivar though broader crowned varieties are better. A good choice for a large, hardy shade tree for park situations.

**Tilia cordata** - Littleleaf Linden
zone 3-7  water 3
Deciduous; often pyramidal-shaped tree; grows to 60' x 30'. Easily transplanted; full sun; prefers well-drained soil and is soil-pH tolerant. Aphids can be a problem. Excellent shade tree with several nice cultivars.

**Ulmus parvifolia** - Lacebark Elm
zone 5-9  water 2
Deciduous, introduced elm; moderate to fast growth to 40' x 40'; attractive bark. Adaptable to soil and pH conditions, works well in urban settings. Much better than *Ulmus pumila*, or Siberian Elm, though not as cold hardy.

**Zelkova serrata** - Japanese Zelkova
zone 5-8  water 2
Deciduous; green leaves with yellow/red fall color. Moderate growth to 50' x 50'; full sun, tolerates pH's of 6-8. Wind, drought, and pollution tolerant. Suited to lawns and parks.

---

**SHRUBS**

**Amorpha canescens** - Leadplant, False Indigo
zone 2  water 1
Deciduous, pinnately compound leaves changing to yellow in fall; purple flower; moderate growth to 2' - 4' x 4' - 5'. Full sun; tolerant to wide range of soils; pH of 7-8.

**Amorpha fruticosa** - Indigo Bush Amorpha
zone 2  water 1
Deciduous, multi-stemmed shrub with a spread to 4'-10'. Blue flowers. Drought tolerant. Full sun.

**Arctostaphylos patula** - Greenleaf Manzanita
zone 2-6  water 1
Native, evergreen shrub growing to 3’-6’ in height. Bright green leaves with red stems. Full sun. Pink flowers in spring.

**Aronia melanocarpa** - Black Chokeberry
zone 3-8  water 2
A small, deciduous shrub growing to 5’-10’ in height. Suckers to form large thickets. Red fall color, purple/black fruit, adaptable to many conditions. Variety *elata* is best for landscapes. Use as a mass planting.

**Artemisia cana** - Silver Sagebrush
zone 3  water 0
Native, silver-leafed sage; evergreen leaves. Moderate growth of 3' - 4' x 5' -10' width. Full sun; tolerant of most soils. Suckers profusely.

**Caragana arborescens** - Siberian Peashrub
zone 2-7  water 1
Introduced, deciduous shrub with moderate to fast growth up to 15'-20' x 12'-18'. Yellow flowers; full sun; tolerant of saline soils and sprays, most soils, alkalinity, wind and drought. Good for hedge or windbreak in difficult situations.

<tbody>
<tr>
<td><em>Caragana pygmaea</em> - Pygmy Peashrub</td>
<td>3-7</td>
<td>1</td>
<td>Deciduous; moderate growth rate; height of 2'-3' x 4'-5'; yellow flowers. Full sun. Tolerant of various soil types, salt, and high pH.</td>
</tr>
<tr>
<td><em>Cercocarpus ledifolius</em> - Curl-leaf Mtn. Mahogany</td>
<td>2</td>
<td>0</td>
<td>Evergreen native; dull green leaf color year-round; slow growing to 15'-20' x 15'. Needs well-drained soils and a pH of 6-7. Withstands shearing.</td>
</tr>
<tr>
<td><em>Cercocarpus montanus</em> - Mountain Mahogany</td>
<td>2</td>
<td>0</td>
<td>Native, deciduous shrub with pink flowers and white fruit; slow growing to 6-9&quot; x 6' in full sun. Poor tolerance to salts. Grows best in well-drained soils.</td>
</tr>
<tr>
<td><em>Chamaebatiaria millefolium</em> - Fernbush</td>
<td>4</td>
<td>1</td>
<td>Native, deciduous shrub with finely pinnate foliage; white blooms during the summer; grows to 8' x 8'. Tolerant to high pH soils.</td>
</tr>
<tr>
<td><em>Cornus sericea</em> - Redstemmed Dogwood</td>
<td>2-8</td>
<td>2</td>
<td>Native, deciduous shrub with outstanding red bark; fast growing to 7' x 10'; shade to full sun; low salt tolerance. Adaptable to a wide range of soils and irrigation levels.</td>
</tr>
<tr>
<td><em>Cotinus coggyria</em> - Smokebush</td>
<td>5-9</td>
<td>2</td>
<td>Deciduous; blue-green to purple leaves; flowers have dense hairs giving a smokey appearance. Moderate growth to 10' x 10'. Adaptable to most well-drained soils and pH's. Full sun. Good for shrub border. No serious pests.</td>
</tr>
<tr>
<td><em>Cotoneaster acutifolius</em> - Peking Cotoneaster</td>
<td>4-7</td>
<td>2</td>
<td>Dense deciduous shrub with reddish flowers in the spring. The rounded form grows to 8' with equal width. Dark green foliage which turns orange-red in the fall. Black fruit in fall.</td>
</tr>
<tr>
<td><em>Cotoneaster apiculatus</em> - Cranberry Cotoneaster</td>
<td>5-7</td>
<td>1</td>
<td>Deciduous; dark green leaves. Slow growth to 3' x 3-6'; small pink flowers with prominent red fruit. Tolerates high pH, salinity, and drought. Well-drained. Effective as foundation plant or bank cover. No serious pests.</td>
</tr>
<tr>
<td><em>Cotoneaster divaricatus</em> - Spreading Cotoneaster</td>
<td>5-7</td>
<td>1</td>
<td>Deciduous; dark green leaves. Moderate to fast growth to 5' x 6'; small flowers and fruit. Tolerances similar to C. lucidus. One of the best cotoneasters.</td>
</tr>
<tr>
<td><em>Ephedra viridis</em> - Brigham Tea</td>
<td>3-6</td>
<td>0</td>
<td>Unique, native, slow growing shrub with jointed stems. Grows to 2' - 5' x 2' - 4'. Small yellow flowers provide late spring to mid-summer interest. Somewhat similar to Scotch broom in the landscape.</td>
</tr>
<tr>
<td><em>Euonymus alatus</em> 'Compacta' - Dwarf Firebush</td>
<td>5-8</td>
<td>2</td>
<td>Deciduous, green leaves with brilliant red fall color. Slow growing to 6' x 6'. Full sun to full shade. Tolerant of high pH (6-8), but must be well-drained. Good, clean plant with multiple uses. Not drought tolerant.</td>
</tr>
<tr>
<td><em>Fallugia paradoxa</em> - Apache Plume</td>
<td>5</td>
<td>0</td>
<td>Native, deciduous shrub with distinctive plumed seed head. Flowers are inconspicuous. Grows to 5'-8' x 4'.</td>
</tr>
<tr>
<td><em>Forestiera neomexicana</em> - Desert Olive</td>
<td>6</td>
<td>0</td>
<td>Deciduous shrub or small tree native to the southwest. Grows to 20' x 8'; fragrant flowers, small black berries.</td>
</tr>
<tr>
<td><em>Forsythia x intermedia</em> - Forsythia</td>
<td>5-8</td>
<td>2</td>
<td>Deciduous; yellow blossoms early in spring; full sun. Fast growing to 8' x 10'; tolerant of high pH; moderately tolerant to salt sprays; withstands urban conditions. No significant pest problems. Chief value is spring flowers.</td>
</tr>
</tbody>
</table>
**Holodiscus dumosus** - **Rockspray Spiraea** 
zone 3  
Deciduous native shrub; green leaves; white/pink flower in spring; full sun. Slow growing to variable height and width; requires well drained soils; can tolerate high pH. No significant pest problems. Largely uncultivated.

**Juniperus chinensis** - **Chinese Juniper** 
zone 3-9 water 1  
Evergreen shrub; highly variable in size and color; full sun. Requires well-drained soils, pH tolerant. Susceptible to root rot when over-irrigated. Many cultivars available, including old Pfitzer types.

**Juniperus communis** - **Common Juniper** 
zone 2-6 water 1  
Evergreen shrub; slow growth to 5'-10' x 8'-12'. Gray-green to blue-green in color. Full sun; wind tolerant. Adaptable to any well-drained soil. Very hardy; several cultivars.

**Juniperus horizontalis** - **Creeping Juniper** 
zone 3-9 water 1  
Evergreen; green to blue/green color; moderate growth to 1'-2' x 4'-8'. Full sun; tolerant to most soils. More tolerant of heavy soils than other junipers. Many cultivars.

**Juniperus sabina** - **Savin Juniper** 
zone 3-7 water 1  
Evergreen; green needles; moderate growth to 4'-6' x 5'-10', depending on cultivar. Full sun; well-drained, dry soils. Tolerant of urban conditions. Good cultivars are ‘Broadmoor’, ‘Buffalo’ Calgary Carpet, and var. tamariscifolia. Potential for root rots.

**Ligustrum vulgare** - **Privet** 
zone 5-7 water 2  
Glossy green foliage, slow growing to 12' x 12'; small, white flowers with black fruit. Selected varieties are improvements over the species. Used for hedges; susceptible to twig blight.

**Mahonia aquifolium** - **Oregon Grapeholly** 
zone 5-8 water 2  
Broadleaf evergreen, leaf color from bronze-red-green-purple; blue-black berry; slow growth to 4' x 4'. Needs moist soils, shade (especially in winter) and low pH. Can do quite well in loam soils with higher pH.

**Mahonia fremontii** - **Fremont Barberry/Utah Holly** 
zone 3 water 0  
Native broadleaf evergreen; gray/green leaf color; holly-like leaf. Slow growing to 5' x 3'. Full sun; well-drained soil.

**Mahonia repens** - **Creeping Mahonia** 
zone 3 water 1  
Native broadleaf evergreen groundcover; green leaves changing to hues of green to red in fall; holly-like leaf; slow growing to 1' x 1'; partial shade to full sun. Tolerates high pH; low salt tolerance; requires well drained soils. No major pest problems.

**Pinus mugo** - **Mugo Pine** 
zone 2-7 water 1  
Evergreen; two-needled pine; slow growing to variable size; full sun. Tolerant to high pH. Excellent alternative to junipers. Few disease or insect problems.

**Potentilla fruticosa** - **Potentilla** 
zone 2-7 water 1  
Deciduous native plant with many selected cultivars; slow growth to 1'-4' x 2'-4'; wide range of flower colors; full sun to partial shade. Withstands poor, dry soils if well-drained. Tolerant of high pH. Few diseases or pests. Good color and blooming period.

**Prunus besseyi** - **Sand Cherry** 
zone 3-6 water 1  
Deciduous shrub; shiny gray-green leaves with yellow fall color; white flower; full sun. Moderate growth to 4' tall; suckers. Low salt tolerance, but tolerant to heat and high pH. Few disease or insect problems.

**Prunus virginiana** - **Chokecherry** 
zone 2-6 water 1  
Native deciduous shrub; green leaves changing to yellow in fall; unique white flower followed by red-black berries; full sun. Moderate growth rate to 12' x 8'; tolerant to wide range of soils; riparian. Susceptible to black knot; suckers profusely; fruit used for jellies.
**Purshia mexicana var. Stansburiana** – Cliffrose

Native deciduous shrub; tolerates drought and poor soil conditions. Slow growing to 5', full sun. Both foliage and flowers are aromatic. Yellow, rose type flowers cover the plant during the summer.

**Pyracantha coccinea** - Firethorn

Broadleaf evergreen; white flower with bright orange berry; partial shade to full sun. Moderate to fast growth to 12' x 12'; best with well-drained soil and near neutral pH. Susceptible to fireblight.

**Rhus glabra** - Smooth Sumac

Native deciduous shrub; green foliage with bright red fruit and fall leaf color; fast growing to 9'-15'; full sun. Soil and salt spray tolerant; few pests; suckers.

**Rhus glabra** 'Cismontana' – Dwarf Mountain Sumac

Deciduous, dwarf shrub; green foliage with bright red fruit and fall leaf color; fast growing to 2'-5' x 3'-4'; full sun. Suckers and can be invasive.

**Rhus glabra** – Oakleaf Sumac

Native deciduous shrub; green foliage with red fall color and red berries; full sun. Moderate growth rate to 6' x 10'; tolerant of most soils. No serious pest problems.

**Rhus glabra** 'Cismontana' – Dwarf Mountain Sumac

Deciduous shrub; green leaves with bright red fall color and fruit; full sun. Fast growing to 12' tall; suckers readily and can be invasive; tolerant to high pH and urban conditions. Few disease problems.

**Rhus trilobata** – Oakleaf Sumac

Native deciduous shrub; green foliage with bright red fruit and fall leaf color; fast growing to 9'-15'; full sun. Soil and salt spray tolerant; few pests; suckers.

**Rhus typhina** – Staghorn Sumac

Deciduous shrub; green leaves with bright red fall color and fruit; full sun. Fast growing to 12' tall; suckers readily and can be invasive; tolerant to high pH and urban conditions. Few disease problems.

**Ribes aureum** - Golden Current

Native shrub, fast growing to 4'-6'; full sun. Fragrant yellow flowers in the spring and orange to black fruit throughout the year.

**Rosa foetida** bicolor - Austrian Brier Rose

Similar to Austrian Copper, but with yellow blooms.

**Rosa foetida** 'Persiana' – Persian Yellow Rose

Deciduous; deep yellow blossom and hips; green leaves; full sun. Moderate growth rate to 4' x 4'. 'Austrian Copper' is a fantastic cultivar with copper-red flower petals.

**Rosa rugosa** - Rugosa Rose

Deciduous; leaves green to orange/red in fall; fast growing to 5' x 5'. Tolerant to salt, pH, most soils if well-drained. Very trouble free for a rose.

**Rosa woodsii** - Woods Rose

Deciduous, native rose; green foliage with pink blooms and orange fruit; full sun. Moderate growth to 4' x 4'; salt tolerant; requires well-drained soil.

**Salvia dorri** - Dorr Sage

Wood, deciduous shrub, moderate growth to 2'-3'; full sun. Gray-green leaves have a sage-like aroma. Blue flowers in spring are especially attractive to bees and butterflies.

**Shepherdia argentea** - Silver Buffaloberry

Native, deciduous shrub; silver foliage with red/orange flower and fruit; not showy; full sun. Moderate growth to 10' x 10'; Tolerant to high pH and moderate salinity.

**Shepherdia rotundifolia** - Roundleaf Buffaloberry

Native, deciduous shrub; silver foliage with soft gray hairs on the underneath side. Slow growth rate to 3'-4'. Tolerant of high pH and moderate salinity.
**Spirea x bumalda - Bumald Spiraea**  
zone 3-8 water 3  
Deciduous shrub; light green leaves with lavender blooms; full sun. Moderate growth to 2’ x 2’; not tolerant to high pH or soil salinity. Susceptible to iron chlorosis. Fruit and spent blossoms rather unsightly.

**Symphoricarpos albus - Snowberry**  
zone 3-7 water 2  
Deciduous; white flowers with white berry and green leaves; full to partial shade. Fast growth to 4’ x 4’; tolerant to high pH but not soil salinity. Suckers. No serious disease or insect problems.

**Symphoricarpos oreophilus - Mountain Snowberry**  
zone 2 water 2  
Native snowberry; green foliage with white flowers and berries; full sun to partial shade. Fast growing to 5’ x 3’; requires well-drained soil, low salinity and neutral pH.

**Syringa meyeri 'Palibin' - Dwarf Korean Lilac**  
zone 3-7 water 2  
Deciduous, dwarf shrub. Flowers lilac to lavender in color.

**Syringa patula - Miss Kim Lilac**  
zone 3-7 water 2  
Deciduous dwarf shrub growing to 3’-5' x 3’-5’; glossy green leaves turn burgundy red in fall; pale, lilac colored flowers.

**Syringa vulgaris - Common Lilac**  
zone 3-7 water 1  
Deciduous shrub; green foliage with white to purple flowers; fragrant; full sun. Moderate growth to 10’ x 10’; tolerant of high pH and salt spray. Affected by powdery mildew and ash borer, but not seriously. Very tough, traditional plant. Many cultivars available.

**Taxus cuspidata - Japanese Yew**  
zone 4-7 water 3  
Evergreen, dark green needle-like leaves. Slow growing to various sizes depending on cultivar; red fruit. Does very well in shade; avoid winter sun; pollution tolerant. No serious diseases or insects. Used for foundation plantings, screens and hedges.

**Taxus x media - Anglojap Yew**  
zone 4-7 water 3  
Similar to *Taxus cuspidata*. Slow growing to variable sizes. Many selected cultivars. Does well in shade and must be protected from winter sun. Soil should be well-drained, moist and acid to neutral.

**Yucca filamentos - Yucca**  
zone 3 water 0  
Native evergreen with long, narrow leaves and white blossoms on a tall spike. Full sun. Slow growing to 2’ x 2’. Tolerant to salt sprays and high pH.

**GRASSES**

**Festuca arundinacea - Tall Fescue**  
cool season water 2  
Turf-type; bunch grass; dark green color; tall; partial shade to full sun; requires well drained soil.

**Festuca ovina - Sheep Fescue**  
cool season water 0  
Ornamental/ground cover; bunch grass; blue/green color; low-moderate height; full sun; requires low salinity and well drained soil.

**Festuca rubra - Red Fescue**  
cool season water 3  
Turf-type; rhizomatous; green color.
**Lolium perenne** - Perennial Rye  
cool season  water 3  
Turf-type; bunch grass; green color; partial shade to full sun

**Oryzopsis hymenoides** - Indian Ricegrass  
cool season  water 0  
Native; ornamental; bunch grass; green color; moderate height; moderately salt tolerant; requires well-drained soil.

**Poa pratensis** - Kentucky Bluegrass  
cool season  water 3  
Native; turf-type; rhizomatous; green color; moderate height; low salinity tolerance; needs well-drained soils.

---

**HERBACEOUS PERENNIALS**

**Achillea millefolium** - Yarrow  
zone 3  water 0  
Native; pink, red, white, and yellow flowers over green dissected leaf; mid to late season bloomer; height 12"-36"; use for borders or naturalized areas. Needs well-drained soils, full sun. Susceptible to mildew.

**Aegopodium podagraria 'Variegatum'** - Bishop's Weed  
zone 4-8  water 3  
Leaves light green with white margins; height 8"-10"; vigorously growing and spreading. Full sun or shade, with shade best in warmer areas. No soil preference. Used as a ground cover. Can be invasive. Tends to scorch and look unsightly in heat of summer.

**Anaphalis margaritacea** - Pearly Everlasting  
zone 4  water 1  
Native; white flower with gray foliage; mid to late season bloom; height 24"-36"; use for borders. Needs well-drained soils and partial shade. Can be invasive.

**Antennaria rosea** - Field Pussytoes  
zone 4  water 2  
Native; white to pink flowers with white/gray foliage; blooms early in season; height 3"-12"; use for rock gardens. Tolerant to wide range of soil types; full sun.

**Armeria maritima** - Sea Pink  
zone 4  water 2  
Evergreen leaves in clumps with pink or white flowers; leaves 3"-4" with flowers to 12" tall. Blooms in mid to late spring. Full sun; dry soils. Very salt tolerant; use for edges and rock gardens.

**Artemisia frigida** - Fringed Sage  
zone 3  water 0  
Native; gray foliage with inconspicuous flowers; height 16"; used for foliage effects. Tolerant to various soil types; full sun. Requires trimming.

**Artemisia schmidtiana** - Silver Mound  
zone 3  water 0  
Gray foliage with inconspicuous flowers; height 12"; used for foliage and as a border. Requires well-drained soils and full sun. Susceptible to rust; can become rather rank growing.

**Asclepias tuberosa** - Butterfly Weed  
zone 3  water 1  
Native; multiple flower colors with green foliage; blooms mid to late season; height 24"-36"; used for border or naturalized areas. Tolerant to most soils; full sun. Pest free.

**Aubrieta deltoidea** - Purple Rock Cress  
zone 4  water 1  
Purple flowers; blooms early to mid-season; height 6"; use in bed, edging or rock garden. Use in full sun with well-drained soil. Should be trimmed to maintain compact form. No serious diseases or insects.

**Aurinia saxatile compactum** - Dwarf Basket of Gold  
zone 4  water 2  
Yellow blooms with gray foliage; early season bloomer; height 4"-6"; best use is for rock gardens. Requires a well-drained soil and full sun.
**Baptisia australis** - Blue False Indigo  
Blue flowers. Good as a border plant. Full sun, well-drained soil. A member of the legume family. Easy to grow and pest free.

**Callirhoe involucrata** - Poppy Mallow  
White or purple blooms with green foliage; blooms all season long; height 6”-12”; use in border or rock garden. Tolerant of soil extremes; full sun.

**Campanula rotundifolia** - Bluebells of Scotland  
Bright blue 1-inch flowers in early to late summer; self seeding. Grows 1’-2’ high; requires well drained soils and full sun.

**Centaurea montana** - Bachelor Button  
Blue or white flowers with green to gray foliage; blooms early to mid-season; height 12”-18”; use for border. Requires well-drained soil; partial shade to full sun. Invasive.

**Centranthus ruber** - Jupiter's Beard  
Pink, white, or red flowers with green foliage; blooms in mid-season; height 24”-36”, used for borders and naturalized areas. Requires well drained soils, tolerant to high pH; partial shade to full sun.

**Cerastium tomentosum** - Snow-in-Summer  
White blooms on green to gray foliage; blooms early to mid-season; height 3”-10”; used for borders, rock gardens and as a ground cover. Requires well drained soils and full sun.

**Dianthus barbatus** - Sweet William  
A self-sowing biennial, 6”-10” tall, with a flat cluster of flowers. Used in borders or rock gardens. No scent.

**Dianthus ‘Zing Rose’** - Zing Rose Dianthus  
Grows to 6” tall, blooms from June to summer with rose red flowers. Dense green foliage.

**Dicentra eximia** - Fringed Bleeding-heart  
Finely dissected gray-blue evergreen leaves, 12”-18” tall with pink to purple flowers. Partial shade with well-drained soil. Excellent for borders and rock gardens.

**Dicentra spectabilis** - Bleeding-heart  
Pink, white, and red flowers with green foliage; blooms in mid-season; height 6”-36”. Used for borders, requires well drained loam, partial shade. Susceptible to stem rot.

**Echinacea purpurea** - Purple Coneflower  
Purple flowers with green foliage; blooms in mid- to late season; height 30”-40”; use in borders or naturalized areas. Requires a well-drained soil; full sun. Leaf spot disease.

**Gaillardia aristata** - Indian Blanket Flower  
Native; flowers are a mix of orange, red, and yellow; blooms mid- to late season; height 12”-30”; use for cutting, border or naturalized areas. Tolerant to most soils; full sun. Few serious problems.

**Hemerocallis Hybrids** - Daylily  
Multiple flower colors with green, grassy foliage; blooms mid- late season; height 15”-30”; use for borders or naturalized areas. Tolerant to most soils; partial shade to full sun. Very few problems.

**Iberis sempervirens** - Candytuft  
Forms a mound 6”-12” by 24” with linear, evergreen leaves. White flowers in spring cover the whole plant. Needs full sun and well-drained soils. Best for rock gardens and edging. Should be cut back after blooming to keep full.
**Iris Hybrids - Iris**  
Zone 3  Water 1  
Multiple flower colors with green, grassy foliage; early blooming; height 6"-48"; use for borders and cut flowers. Tolerant to most soils, should be well-drained; full sun. Can be minor problems with borers and rots.

**Linum perenne - Flax**  
Zone 3  Water 0  
Blue or white flowers with green foliage; blooms in mid- late season; height 12"-24"; use for naturalized areas or borders. Well drained soils, no serious problems.

**Lupinus 'Russell Hybrid' - Lupine**  
Zone 3  Water 3  
Multiple flower colors with green foliage; blooms in mid-season; height 18"-36"; use in borders. Requires well-drained soils, quite tolerant to other soil factors; partial shade to full sun.

**Monarda didyma - Bee Balm**  
Zone 3  Water 3  
Multiple flower colors in white/red/purple; blooms in mid- late season; height 18"-42"; use in mass plantings and naturalized areas. Full sun to partial shade. Few pests, but may be invasive.

**Narcissus species - Daffodil**  
Zone 3  Water 2  
Flowers of white, orange, or yellow; blooms early; height 6"-24"; use in mass plantings or naturalized areas. Loam soil; full sun. Best of spring flowering bulbs for naturalizing.

**Oenothera elata - Showy Primrose**  
Zone 2  Water 2  
Native primrose with yellow, orange, or red flowers; blooms from July to September; height 24"-48"; use as a border or naturalized areas. Full sun.

**Oenothera missouriensis - Missouri Primrose**  
Zone 3  Water 1  
Yellow, 3"-4" wide blossoms that open in summer evenings. Tolerant of poor soils and full sun. Works well in rock gardens, edges, and raised beds.

**Papaver orientale - Oriental Poppy**  
Zone 3  Water 2  
Red, orange or pink flowers with green foliage; blooms early to mid-season; height 24"-48"; use as border or cut flowers. Needs well-drained soils and partial shade to full sun.

**Penstemon species - Penstemon**  
Zone 0  Water 0  
Native group of several species with a wide range of flower colors; blooms in mid-season; height 12"-36"; use as border or naturalized. Requires well-drained soils; full sun. Over irrigation causes root rot. **Barbatus** (Beardlip Penstemon) is an excellent species.

**Phlox subulata - Creeping Phlox**  
Zone 3  Water 3  
Purple, pink or white flowers on spikes to 2"-4' tall. Grows well in full sun or partial shade; may require staking if in fertile soils. An aggressive spreader, it is good for back grounds and cut flowers.

**Physostegia virginiana - Obedient Plant**  
Zone 3  Water 3  
Rose-purple or white flowers on spikes to 2"-4' tall. Grows well in full sun or partial shade; may require staking if in fertile soils. An aggressive spreader, it is good for back grounds and cut flowers.

**Ratibida columnifera - Prairie Coneflower**  
Zone 4  Water 1  
Native with yellow and purple flower and green foliage; blooms in mid- to late season; height 12"-20" in use in naturalized areas. Needs well-drained soils and full sun.

**Rudbeckia hirta - Gloriosa Daisy**  
Zone 3  Water 1  
Flowers in shades of red/yellow with green foliage; blooms mid- to late season; height 24"-36"; use as a border plant. Tolerant of most soils; full sun to partial shade. Susceptible to mildew and sawfly damage.
Saponaria ocymoides - Soap Wort  
zone 3  water 2
A 4"-10" trailing plant with a pink flower in late spring. Does well in full sun with well drained, even poor quality soils. Good for rock gardens and stone walls. Should be cut back annually.

Sedum species - Sedum  
zone 4  water 0
Multiple flower colors with succulent foliage in shades of green to red; blooms early; height 8"-18"; use as ground cover or rock garden plant. Well drained soils and full sun.

Solidago hybrids - Goldenrod  
zone 2  water 2
Native with yellow flowers and green foliage; height 36"-60"; use in borders or naturalized areas. Requires well-drained soils and partial shade to full sun. Susceptible to rust.

Stachys bysantia - Lamb’s Ear  
zone 4  water 1
Lavendar blossom with gray foliage; blooms mid- late season; height 8"-24"; use in border. Does best in well-drained soils and full sun. Used as a ground cover.

Thymus species - Thyme  
zone 3  water 3
Pink, red or white flowers with gray foliage; blooms in mid-season; height 3"-8"; use as a rock garden plant. Tolerant to most soils; requires full sun.

Tulipa Hybrids - Tulip  
zone 2  water 1
Multiple flower colors and forms with green foliage; blooms early; height 8"-24"; use naturalized or as a border plant. Must have well-drained soils and full sun for good performance and prevention of bulb rots.

Veronica spicata - Spike Speedwell  
zone 3  water 1
Blue, pink, or red flowers; blooms early to mid-season; height 6"-24"; use in border or rock gardens. Best performance in well-drained loams with partial shade to full sun.

Vinca minor - Periwinkle  
zone 4  water 3
Evergreen groundcover with blue blossoms; blooms early; height 6"-8"; use as a ground cover in full sun to full shade.
